Received 16 February 2010; accepted 17 February 2010

Key indicators: single-crystal X-ray study; $T = 173$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.043; wR factor = 0.117; data-to-parameter ratio = 13.2.

In the title compound, $[\text{Cu}(\text{C}_8\text{H}_4\text{O}_4)(\text{C}_{16}\text{H}_{20}\text{N}_4)(\text{H}_2\text{O})]_n$, square-pyramidal coordinated Cu^{II} ions are linked into $[\text{Cu}(\text{H}_2\text{O})(\text{isophthalate})]_n$ coordination polymer chains by isophthalate dianions. These chains are connected into undulating $[\text{Cu}(\text{H}_2\text{O})(\text{isophthalate})(3\text{-bpmp})]_n$ [3-bpmp is bis(3-pyridylmethyl)piperazine] layers by 3-bpmp tethering ligands. The *pseudo* three-dimensional structure of the title compound is fostered by interlayer O–H···O hydrogen bonding between the aqua ligands and unligated isophthalate O atoms. The selected crystal was non-merohedrally twinned. Only reflections from the major twin component were used in the solution and refinement.

Poly[[aqua] μ -1,4-bis(3-pyridylmethyl)piperazine- $\kappa^2N:N'$](μ -isophthalato- $\kappa^2O^1:O^3$)copper(II)]

C. M. Gandolfo and R. L. LaDuca

Comment

The title compound (I) was prepared by the hydrothermal reaction of copper nitrate, isophthalic acid and bis(3-pyridylmethyl)piperazine (3-bpmp). Its asymmetric unit (Fig. 1) contains a divalent copper atom, an aqua ligand, a fully deprotonated isophthalate ligand, and halves of two crystallographically independent 3-bpmp ligands whose central piperazinyl rings contain crystallographic inversion centers. In contrast to the previously reported phase $\{[Cu(H_2O)(isophthalate)(3-bpmp)]\cdot 2H_2O\}_n$ (Johnston, *et al.*, 2008) no water molecules of crystallization are present in the title compound.

The basal plane of the distorted square pyramidal $\{CuO_3N_2\}$ coordination sphere contains two *trans* pyridyl N atom donors from crystallographically distinct 3-bpmp ligands and two *trans* O atom donors from different isophthalate ligands. The apical position is occupied by the aqua ligand.

Isophthalate ligands in a bis(monodentate) bridging mode link the Cu^{II} ions into one-dimensional $[Cu(H_2O)(isophthalate)]_n$ coordination polymer chains arranged along the *b* crystal direction. The Cu···Cu distance through the isophthalate ligands measures 10.0328 (5) Å, defining the *b* lattice parameter. In turn, these chains are connected into undulating $[Cu(H_2O)(isophthalate)(3-bpmp)]_n$ coordination polymer layers by 3-bpmp tethering ligands (Fig. 2). These layers are arranged parallel to the *bc* crystal planes. The crystallographically distinct 3-bpmp ligands promote two different through-ligand Cu···Cu contact distances, 12.394 (6) and 12.830 (6) Å. The "wavelength" of the undulations in the layer motifs is 16.7456 (9) Å, which defines the *c* lattice parameter. Intralayer hydrogen bonding between the aqua ligands and unligated isophthalate O atoms provides additional stabilization of the layer motifs.

Adjacent $[Cu(H_2O)(isophthalate)(3-bpmp)]_n$ layers stack in an *AAA* pattern along the *a* crystal direction. Interlayer hydrogen bonding between the aqua ligands and unligated isophthalate O atoms provides the supramolecular interactions necessary to generate the *pseudo* three-dimensional structure of the title compound.

Experimental

All starting materials were obtained commercially, except for 3-bpmp, which was prepared according to a literature procedure (Pocic, *et al.*, 2005). A mixture of $Cu(NO_3)_2 \cdot 2.5H_2O$ (72 mg, 0.30 mmol), isophthalic acid (49 mg, 0.30 mmol), and 3-bpmp (79 mg, 0.30 mmol) and 10.0 g water (550 mmol) was placed into a 15 ml borosilicate glass vial, which was then sealed and heated under autogenous pressure at 363 K for 120 h. Blue-green blocks of the title compound were obtained along with a green polycrystalline material.

supplementary materials

Refinement

All H atoms bound to C atoms were placed in calculated positions, with C—H = 0.95 - 0.99 Å, and refined in riding mode with $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$. The H atoms bound to the aqua ligand O atom was found in a difference Fourier map, restrained with O—H = 0.85 Å, and refined with $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{O})$.

Figures

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.117$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.16$	$w = 1/[\sigma^2(F_o^2) + (0.038P)^2 + 0.3004P]$ where $P = (F_o^2 + 2F_c^2)/3$
4141 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
313 parameters	$\Delta\rho_{\text{max}} = 0.44 \text{ e \AA}^{-3}$
3 restraints	$\Delta\rho_{\text{min}} = -0.56 \text{ e \AA}^{-3}$

Special details

Experimental. The selected crystal was non-merohedrally twinned. The twin law was determined using CELLNOW (Sheldrick, 2009). Only reflections from the major twin component were used in the solution and refinement.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
