Received 11 February 2010; accepted 24 February 2010

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.007$ Å; disorder in main residue; R factor = 0.049; wR factor = 0.121; data-to-parameter ratio = 15.0.

In the title compound, $[\text{Zn}(\text{C}_{10}\text{H}_{14}\text{O}_4)(\text{C}_4\text{H}_6\text{N}_2)]_n$, each Zn^{II} ion is coordinated by one N atom from one 2-methyl-1*H*-imidazole ligand and three O atoms from two camphorate (cap) ligands in a distorted tetrahedral geometry. In one of the cap ligands, one methyl group is disordered between positions 1 and 3 in a 0.518 (12):0.482 (12) ratio. Each cap ligand bridges three Zn^{II} ions, forming two-dimensional layers, which interact further via N—H···O hydrogen bonds.

Comment

Coordination polymers based on camphoric acid (cap) have received intense interests because of their potential applications as functional solid materials, as well as their fascinating framework structures (Zhang *et al.*, 2007). We report here the synthesis and structure of the title compound (**I**).

In (**I**) (Fig. 1), each Zn^{II} atom is four-coordinated by one nitrogen atom from one 2-methyl-1*H*-imidazole (mid) ligand and three oxygen atoms from two different camphorate anions (cap) in a distorted tetrahedral geometry. Each cap ligand bridges three Zn^{II} atoms to form a two-dimensional layer structure. Further, the N—H···O H-bonding interactions (Table 1) stabilize the structure of (**I**).

Experimental

A mixture of ZnCl₂·2H₂O (1 mmol), NaOH (1 mmol), D-camphoric acid (1 mmol) and 2-methyl-1*H*-imidazole (1 mmol) in water (12 ml) was heated to 140 °C for three days in a 25 ml Teflon-lined stainless steel vessel under autogenous pressure. Subsequently, it was cooled to room temperature. Then, single crystals of (**I**) were obtained.

Refinement

All H atoms were positioned geometrically (C—H = 0.93–0.98 Å; N—H = 0.86 Å) and refined as riding, with U_{iso}(H)=1.2–1.5U_{eq} of the carrier atom. In cap ligand, one methyl group was treated as disordered between positions 1 (C14) and 3 (C14') in a ratio 0.518 (12):0.482 (12), respectively.

Figures

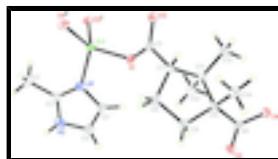

Fig. 1. A portion of the crystal structure of (**I**), showing the atomic numbering and 30% probability displacement ellipsoids [symmetry codes: (i) -x, -y, -z; (ii) x+1/2, -1/2-y, z+1/2]. Only major parts of disordered atoms are shown.

0 restraints

$\Delta\rho_{\min} = -0.41$ e Å⁻³

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
