Received 14 March 2010; accepted 15 March 2010

Key indicators: single-crystal X-ray study; $T = 223$ K; mean $\sigma(C-C) = 0.008$ Å;
 R factor = 0.039; wR factor = 0.087; data-to-parameter ratio = 22.4.

The Au atom in the title compound, [Au(C₁₀H₁₁CINOS)-(C₁₈H₃₃P)], is coordinated within an *S,P*-donor set that defines a slightly distorted linear geometry [S—Au—P = 172.45(5) $^\circ$], with the distortion due in part to a close intramolecular Au···O contact [3.134(3) Å].

Comment

Crystal engineering and luminescence imperatives motivated systematic studies of $R_3PAu[SC(OR')=NR'']$, for R , R' and R'' = alkyl and aryl, derivatives (Ho *et al.* 2006; Ho & Tiekink, 2007; Kuan *et al.*, 2008). The synthesis and characterisation of the title compound, (I), was investigated in this context.

The gold atom in (I) exists within an *SP* donor set defined by the phosphine-*P* and thiolate-*S* atoms, Table 1 and Fig. 1. The carbonimidothioate ligand is functioning as a thiolate as seen by the magnitudes of the C1—S1 [1.750 (5) Å] and C1=N1 [1.257 (6) Å] bond distances. The coordination geometry is distorted from the ideal linear [S—Au—P = 172.45 (5) °] owing to the close approach of the O1 atom [3.134 (3) Å]. No specific intermolecular interactions are noted in the crystal packing.

Experimental

Compound (I) was prepared following the standard literature procedure from the reaction of Cy₃PAuCl and (*i*-Pr)OC(=S)N(H)(C₆H₄Cl-4) in the presence of NaOH (Hall *et al.*, 1993). Crystals were obtained by the slow evaporation of a CH₂Cl₂/hexane (3/1) solution held at room temperature.

Refinement

The H atoms were geometrically placed (C—H = 0.94–0.99 Å) and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5U_{\text{eq}}(\text{C})$. The maximum and minimum residual electron density peaks of 3.49 and 1.06 e Å⁻³, respectively, were located 0.85 Å and 0.70 Å from the Au atom.

Figures

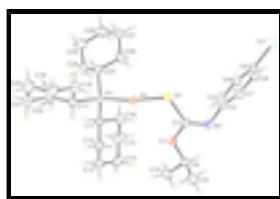

Fig. 1. Molecular structure of (I) showing atom-labelling scheme and displacement ellipsoids at the 35% probability level.

0 restraints

$\Delta\rho_{\min} = -1.06$ e Å⁻³

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
