Received 10 February 2010; accepted 12 March 2010

Key indicators: single-crystal X-ray study; $T = 200\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.020\text{ \AA}$;
 R factor = 0.059; wR factor = 0.174; data-to-parameter ratio = 16.1.

The asymmetric unit of the title compound, $(\text{C}_{13}\text{H}_{10}\text{N})_2[\text{PtCl}_6]\cdot 2\text{H}_2\text{O}$, contains a protonated acridine cation, one half of a $[\text{PtCl}_6]^{2-}$ dianionic complex and a solvent water molecule. The octahedral $[\text{PtCl}_6]^{2-}$ dianion is located on an inversion centre. $\pi-\pi$ interactions between neighboring acridinium cations produce stacks along the a axis; the shortest distance between the centroids of the six-membered rings within the cations is $3.553(9)\text{ \AA}$. In the crystal, two independent intermolecular $\text{O}-\text{H}\cdots\text{Cl}$ hydrogen bonds, both involving the same Cl atom of the anion as acceptor, give rise to chains also running along the a axis; in addition each water molecule, as a hydrogen-bond acceptor, is linked to the acridinium N—H group.

Diacridinium hexachloridoplatinate(IV) dihydrate

K. Ha

Comment

The asymmetric unit of the title compound, $(C_{13}H_{10}N)_2[PtCl_6] \cdot 2H_2O$, contains a protonated acridine cation, one half of a $[PtCl_6]^{2-}$ dianionic complex and a solvent water molecule (Fig. 1). The anion occupies a special position in the inversion centre; the Pt—Cl bond lengths, 2.370 (3), 2.377 (3) and 2.379 (3) Å, are similar to those found in other $PtCl_6$ salts, i.e. $(C_{13}H_{10}N)_2[PtCl_6] \cdot 2C_2H_6OS$ (Karaca *et al.*, 2009), $(C_{14}H_{13}N_2)_2[PtCl_6]$ (Yousefi *et al.*, 2007) and $(HPyX-3)_2[PtCl_6] \cdot 2H_2O$ ($X = Br$ or I) (Zordan & Brammer, 2004).

The essentially planar acridinium cations [maximum deviation from the least-squares plane is equal to 0.025 (17) Å], are stacked in columns along the a -axis (Fig. 2); the shortest distance between the centroids of the six-membered rings in neighboring cations in the stack is equal to 3.553 (9) Å. Two independent O-H···Cl bonds, both involving atom Cl1 of the anion as acceptor (Table 1), give rise to the chains also running along the a -axis; in addition each water molecule, as an H-bond acceptor is linked to the acridinium N-H group (Fig. 2).

Experimental

To a solution of K_2PtCl_6 (0.1999 g, 0.411 mmol) in H_2O (20 ml) was added acridine (0.1548 g, 0.864 mmol) and the mixture was refluxed for 7 h. The precipitate was then separated by filtration, washed with water and acetone, and dried at 50 °C, to give an orange powder (0.2198 g). Crystals suitable for X-ray analysis were obtained by slow evaporation from a CH_3CN solution.

Refinement

H atoms were positioned geometrically and allowed to ride on their parent atoms [$C—H = 0.95$ Å, $N—H = 0.88$ Å and $U_{iso}(H) = 1.2U_{eq}(C, N)$]. The H atoms of the solvent water molecule were located from difference maps then allowed to ride on their parent O atom in the final cycles of refinement [$O—H = 0.84$ Å; $U_{iso}(H) = 1.5U_{eq}(O)$]. The highest peak (1.99 e Å⁻³) and the deepest hole (-2.96 e Å⁻³) in the difference Fourier map are located 0.60 and 0.84 Å from the Cl3 and Pt1 atoms, respectively.

$\gamma = 77.862 (2)^\circ$	$0.24 \times 0.20 \times 0.06 \text{ mm}$
$V = 705.29 (13) \text{ \AA}^3$	

Data collection

Bruker SMART 1000 CCD diffractometer	2725 independent reflections
Radiation source: fine-focus sealed tube graphite	2536 reflections with $I > 2\sigma(I)$
φ and ω scans	$R_{\text{int}} = 0.029$
Absorption correction: multi-scan (SADABS; Bruker, 2000)	$\theta_{\text{max}} = 26.0^\circ, \theta_{\text{min}} = 2.1^\circ$
$T_{\text{min}} = 0.577, T_{\text{max}} = 1.000$	$h = -9 \rightarrow 8$
4295 measured reflections	$k = -12 \rightarrow 12$
	$l = -13 \rightarrow 9$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.059$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.174$	H-atom parameters constrained
$S = 1.21$	$w = 1/[\sigma^2(F_o^2) + (0.0248P)^2 + 22.3646P]$ where $P = (F_o^2 + 2F_c^2)/3$
2725 reflections	$(\Delta/\sigma)_{\max} < 0.001$
169 parameters	$\Delta\rho_{\max} = 1.99 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -2.96 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
