Received 22 March 2010; accepted 25 March 2010

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.018$ Å; R factor = 0.048; wR factor = 0.135; data-to-parameter ratio = 12.5.

The title complex, $[\text{Os}(\text{C}_6\text{F}_5\text{S})_3\text{Cl}(\text{C}_{18}\text{H}_{12}\text{F}_3\text{P})]$, displays a trigonal-bipyramidal Os^{IV} coordination geometry with the S atoms of three thiolate ligands occupying the equatorial positions. The thiolate pentafluorophenyl substituents are all placed above the equatorial plane, forming a claw-like cavity which accommodates the chloride ligand with a normal Os—Cl bond length. The phosphine ligand *trans* to the chloride ligand reveals a short Os—P bond length compared to other chloride–phosphine Os^{IV} complexes (average = 2.40 Å). This strong bonding indicates that the inductive effect of the F atoms in the phosphine does not affect significantly its basicity, compared to triphenylphosphine. This feature is also consistent with the known poor *trans* influence of Cl^- . The crystal packing involves π – π contacts between inversion-related thiolate C_6F_5 rings, with a centroid–centroid separation of 3.659 (8) Å.

Chloridotris(pentafluorobenzenethiolato- κ S)[tris(4-fluorophenyl)phosphine- κ P]osmium(IV)

A. Arias, L. Meléndez, S. Bernès and M. Arroyo

Comment

We have been interested for a long time in Os^{IV} complexes bearing fluorinated thiolate ligands, as these systems are involved in the study of the C—F bond activation (Arroyo *et al.*, 2007, and references therein). For the five-coordinated complexes with general formula [Os^{IV}(thiolate)₄(phosphine)], the metal centre is invariably found to be in a trigonal-bipyramidal geometry (*e.g.* Mendoza *et al.*, 2006; Cerón *et al.*, 2006; Arroyo *et al.*, 2009), with the phosphine and one thiolate groups placed in axial positions. Of interest are the complexes [OsX(thiolate)₃(phosphine)], where X is an halogen *trans* to the phosphine in a bipyramidal geometry (Hills *et al.*, 1991; Arroyo *et al.*, 1994) and halides are known to have little *trans* influence, allowing the estimation of the basicity of the coordinated phosphine.

The title complex was obtained by reaction of [Os(SC₆F₅)₄(P(C₆H₄F-4)₃)] (space group *P* $\bar{1}$, Arroyo *et al.*, 2009) and HCl(aq) in acetone (see *Experimental*). The complex approximates 3-fold symmetry (Fig. 1), with atoms P1 and Cl1 placed in axial positions. The coordinated Cl⁻ ion is placed in a cavity approximating point symmetry *C*₃, formed by the C₆F₅ groups of the thiolate ligands, all 'up' towards and around the smaller chloride ligand. The trigonal-bipyramidal coordination geometry of the Os^{IV} centre is completed by three S atoms in the equatorial plane.

The chloride ligand is found at the expected distance from the metal center, Os—Cl = 2.414 (2) Å, which compares well with the average Os—Cl bond length retrieved from 804 hits in the CSD, 2.401 Å (CSD, version 5.31 with all updates; Bruno *et al.*, 2002). A quite different situation is observed for the phosphine: the Os—P bond is short, 2.334 (2) Å, compared to other Os^{IV} complexes including the P—Os—Cl fragment (*ca.* 2.40 Å). For all the 340 hits retrieved in the CSD with a P—Os—Cl fragment, the average Os—P bond length is 2.383 (2) Å. The phosphine is thus strongly bonded to the metal centre in the title compound. In spite of the inductive effect of the F atoms in the phosphine, a significant amount of electron density should be donated back to the rings and the P atom, favoring the ligand bonding. This behaviour is consistent with the p*K*_a of that phosphine, 1.97, which is close to the p*K*_a of triphenylphosphine, 2.73 (Allman & Goel, 1982). Finally, the strong coordination of tris(4-fluorophenyl)phosphine in the title compound also affects the geometry of this ligand: short P—C bond lengths are observed, in the range 1.787 (10)–1.797 (10) Å, while the mean P—C distance reported in the free tris(4-fluorophenyl)phosphine is 1.825 (5) Å (bin Shawkataly *et al.*, 1996).

The crystal structure is stabilized by intermolecular π – π interactions involving C₆F₅ rings of thiolate ligands related by an inversion centre (Fig. 2). The separation between the centroids of stacked rings is 3.659 (8) Å.

Experimental

The previously prepared complex [Os(SC₆F₅)₄(P(C₆H₄F-4)₃)] (Arroyo *et al.*, 2009) (0.200 g, 0.154 mmol) was dissolved in acetone (50 ml), and HCl 1.5 M (5 ml) was added. The mixture was stirred at room temperature for *ca.* 48 h, monitoring the progress of the reaction by TLC. The solvent was distilled off under vacuum and the solid product was purified through a

supplementary materials

silica gel chromatographic column eluted with hexane-dichloromethane (4:1), affording $[\text{OsCl}(\text{SC}_6\text{F}_5)_3(\text{P}(\text{C}_6\text{H}_4\text{F})_3)]$ (75% yield). Complex decomposes at 423 K, with colour changing from dark-brown to black, and does not show defined melting point. FAB-MS $\{m/z (\%) [\text{fragment}]\}$: 1139 (2) $[\text{M}^+]$, 1121 (4) $[\text{M}^+-\text{F}]$, 1105 (65) $[\text{M}^+-\text{Cl}]$, 1045 (4) $[\text{M}^+-\text{C}_6\text{H}_4\text{F}]$, 941 (100) $[\text{M}^+-\text{SC}_6\text{F}_5]$, 923 (9) $[\text{M}^+-\text{SC}_6\text{F}_5-\text{F}]$, 391 (34) $[\text{M}^+-\text{P}(\text{C}_6\text{H}_4\text{F})_3-2\text{SC}_6\text{F}_5-\text{Cl}]$. Single crystals were obtained by slow evaporation of the eluent at room temperature.

Refinement

Diffraction data were collected at room temperature, and completeness was reduced to 0.99 because 68 reflections were rejected during data reduction. As commonly found in perfluorinated complexes, F atoms display high displacement parameters. As a consequence, significant Hirshfeld differences are observed for some C—C and C—F bonds in the thiolate groups. Limited accuracy is also reflected in the small C—C average bond length in benzene ring C31...C36 (*ca.* 1.36 Å). H atoms were placed in idealized positions, with C—H bond lengths fixed to 0.93 Å, and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{carrier C})$.
