Received 3 March 2010; accepted 8 March 2010

Key indicators: single-crystal X-ray study; $T = 295\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.044; wR factor = 0.097; data-to-parameter ratio = 8.6.

In the title compound, $C_{16}H_{17}\text{NO}$, the two aromatic rings are almost coplanar, making a dihedral angle of $1.9(2)^\circ$. The amide group makes dihedral angles of $48.0(3)$ and $48.6(3)^\circ$ with the 2-methylphenyl and the 2,5-dimethylphenyl rings, respectively. Intermolecular N—H···O hydrogen bonds link the molecules into chains running along the a axis of the crystal.

N-(2,5-Dimethylphenyl)-2-methylbenzamide

B. T. Gowda, M. Tokarcík, J. Kozísek, V. Z. Rodrigues and H. Fuess

Comment

As a part of our efforts to explore the effect of the substituents on the structures of benzamilides (Gowda, Foro *et al.*, 2008*a,b*; Gowda, Tokarčík *et al.*, 2009), in the present work, the structure of 2-methyl-N-(2,5-dimethylphenyl)benzamide (I) has been determined.

In the structure of (I) (Fig. 1), the N—H and C=O groups are in antiperiplanar conformation. This conformation is similar to those already observed, *e.g.* in 2-methyl-*N*-(phenyl)benzamide (II) (Gowda, Foro *et al.*, 2008*a*), 2-methyl-*N*-(2,6-dimethylphenyl)-benzamide (III) (Gowda, Foro *et al.*, 2008*b*) and in 2-methyl-*N*-(2,4-dimethylphenyl)benzamide (IV) (Gowda, Tokarčík *et al.*, 2009). Further in (I), the conformation of the C=O group to the methyl substituent in the 2-methylphenyl ring is *syn*. This conformation is similar to those observed in (II) and (IV). The bond parameters in (I) are similar to those in (II), (III) and (IV) and other benzamilides (Gowda, Foro *et al.*, 2008*a,b*; Gowda, Tokarčík *et al.*, 2009).

The two aromatic rings are almost coplanar, with the dihedral angle of 1.9 (2)°. The amido group makes dihedral angles of 48.0 (3)° and 48.6 (3)° with the 2-methylphenyl and the 2,5-dimethylphenyl rings, respectively. In the crystal structure, the intermolecular N—H···O hydrogen bonds (Table 1) link the molecules into chains running along the *a*-axis of the crystal (Fig. 2).

Experimental

The title compound was prepared according to the method described by Gowda, Foro *et al.* (2008*b*). The purity of the compound was checked by determining its melting point. It was characterized by recording its infrared and NMR spectra. Block-like colourless single crystals of the title compound were obtained by slow evaporation from an ethanol solution (0.5 g in about 30 ml of ethanol) at room temperature.

Refinement

All hydrogen atoms were positioned with idealized geometry using a riding model with C—H = 0.93 Å or 0.96 Å and N—H = 0.86 Å. The $U_{\text{iso}}(\text{H})$ values were set at $1.2U_{\text{eq}}(\text{C-aromatic}, \text{N})$ and $1.5U_{\text{eq}}(\text{C-methyl})$. The C16 methyl group exhibits orientational disorder in the positions of H atoms. In the last cycles of refinement, all H atoms were treated as riding on their parent atoms.

The two sets of methyl hydrogen atoms were refined with occupancies 0.74 (4) and 0.26 (4). In the absence of significant anomalous scattering, the absolute structure could not be reliably determined and then the Friedel pairs were merged and any references to the Flack parameter were removed.

supplementary materials

Figures

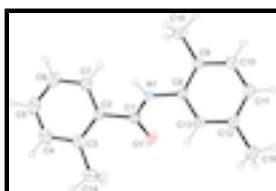

Fig. 1. Molecular structure of the title compound showing the atom labelling scheme. Displacement ellipsoids are drawn at the 30% probability level and H atoms are represented as small spheres of arbitrary radii.

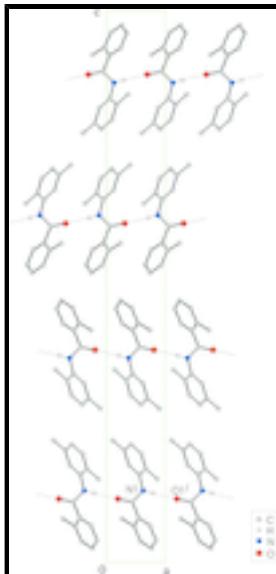

Fig. 2. Molecular packing of the title compound with hydrogen bonds shown as dashed lines. H atoms not involved in hydrogen bonding have been omitted. [Symmetry code: (i) $x + 1, y, z$].

Detector resolution: 10.434 pixels mm ⁻¹	$R_{\text{int}} = 0.037$
ω scans	$\theta_{\text{max}} = 25^\circ, \theta_{\text{min}} = 1.8^\circ$
Absorption correction: multi-scan	$h = -5 \rightarrow 5$

(CrysAlis Pro; Oxford Diffraction, 2009)

$T_{\min} = 0.957$, $T_{\max} = 0.990$

22131 measured reflections

$k = -6 \rightarrow 6$

$l = -54 \rightarrow 54$

Refinement

Refinement on F^2

Primary atom site location: structure-invariant direct methods

Least-squares matrix: full

Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.044$

Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.097$

H-atom parameters constrained

$S = 1.20$

$$w = 1/[\sigma^2(F_o^2) + (0.0248P)^2 + 0.5849P]$$

where $P = (F_o^2 + 2F_c^2)/3$

1414 reflections

$$(\Delta/\sigma)_{\max} < 0.001$$

165 parameters

$$\Delta\rho_{\max} = 0.12 \text{ e \AA}^{-3}$$

0 restraints

$$\Delta\rho_{\min} = -0.13 \text{ e \AA}^{-3}$$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
