Received 5 March 2010; accepted 29 March 2010

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.003$  Å;  
 $R$  factor = 0.039;  $wR$  factor = 0.108; data-to-parameter ratio = 14.7.

The title compound,  $[Co(C_{10}H_{10}BF_6N_4)(C_{15}H_{13}BF_9N_6)]$ , is a neutral Co<sup>II</sup> complex which contains one each of the anionic ligands, bis(3-trifluoromethyl-5-methylpyrazol-1-yl)borate (Bp) and tris(3-trifluoromethyl-5-methylpyrazol-1-yl)borato (Tp). A distorted octahedral coordination geometry results from ligation of an H atom, which is part of an agostic B—H···Co interaction ( $H\cdots Co = 2.17$  Å), and by five imine N atoms, two from a Bp ligand and three from a Tp ligand. In the crystal, molecules form layers parallel to the  $(10\bar{1})$  planes, and the layers are linked along the  $a$  axis by C—H···F hydrogen bonds. An intramolecular C—H···F interaction also occurs.

## {Bis[5-methyl-3-(trifluoromethyl)pyrazol-1-yl]borato}{tris[5-methyl-3-(trifluoromethyl)pyrazol-1-yl]borato}cobalt(II): a structure containing a B—H···Co agostic interaction

R. T. Stibrany and J. A. Potenza

### Comment

Our long-term interest in the synthesis and applications of nitrogen-containing heterocycles, such as expanded-ring imidazoles, and their complexes with metal ions (Stibrany & Potenza, 2009a) led us to prepare the title compound (I). With pyrazole, a variety of metal complexes has been prepared, predominantly with copper (Stibrany & Potenza, 2006), including the Cu(II) complex of an unusual (dimethylamino)methane bridged bis(pyrazole) ligand formed via a DMF aminylation (Stibrany *et al.*, 1999) and a novel binuclear  $\mu$ -oxalato(1-benzylpyrazole)<sub>2</sub>(CF<sub>3</sub>SO<sub>3</sub>)<sub>2</sub>copper(II) compound resulting from the fixation of carbon dioxide (Stibrany *et al.*, 2005). A tris(pyrazolyl)arene ligand which forms geometrically constrained metal complexes has also been prepared (Stibrany *et al.*, 2006), as has a sterically strained trigonal-bipyramidal Cu(II) complex containing a 1-benzylpyrazole ligand (Stibrany & Potenza, 2009b). Copper and cobalt complexes utilizing the title ligand were prepared for oxidation studies (Gorun *et al.*, 2000).

Compound (I) (Fig. 1) contains a central Co<sup>II</sup> ion linked to a Tp and a Bp ligand. Ligation is effected by three imine N atoms of the Tp ligand, two imine N atoms of the Bp ligand, and an H atom which participates in a two-electron, three-center B—H···Co bond. The result is a distorted octahedral coordination geometry.

A number of cobalt(II) complexes containing mixed bis (Bp)- and tris pyrazolylborates (Tp) and C—H···Co agostic interactions have been reported, with H···Co distances ranging from 2.03 Å (Ruman *et al.*, 2002), 2.035 Å (Ruman *et al.*, 2001) to 2.334 Å (Siemer *et al.*, 2001). The H···Co distance in (I), 2.17 Å, lies between these two extremes. Infrared spectral results also support the existence of an agostic 2-electron, 3-center bond in (I). B—H stretching vibrations for BH<sub>2</sub> groups in which one of the H atoms is involved in a 2-electron, 3-center bond with a metal ion typically lie in the range 2100–2500 cm<sup>−1</sup>, with the lower value corresponding to the agostic interaction (Ghosh *et al.*, 1998). In (I), IR bands at 2569 and 2483 cm<sup>−1</sup> are assigned as free B—H stretching vibrations, while the band at 2223 cm<sup>−1</sup> is assigned to the bound B—H group.

In the crystal, the molecules form layers parallel to the (10 -1) planes (Figures 2 and 3), which are linked by intermolecular C—H···F hydrogen bonds (Table 1) in such a way as to form chains along the a cell direction. Platon (Spek, 2009) reveals 11 short intermolecular contacts, 10 of which are C—H···F interactions, which, along with the C—H···F hydrogen bonds noted above suggest that the trifluoromethyl groups in (I) contribute substantially to the stability of the structure.

### Experimental

Both Tp and Bp ligands were prepared as previously reported (Gorun *et al.*, 2000). To a flask containing 10 ml of acetonitrile, 70 mg of Co(ClO<sub>4</sub>)<sub>2</sub>·6 H<sub>2</sub>O (0.19 mmol) was dissolved to give a pink solution. Then 94 mg of Tp (0.19 mmol) was added and the mixture was allowed to stir for 10 min, giving some white precipitate. Then, 67 mg of Bp (0.19 mmol) was added and the mixture was allowed to stir for an additional 15 min. The mixture was filtered to remove white solids and yielded a clear red solution, which was left to evaporate slowly. Upon evaporation, a major dichroic red-orange phase (compound (I))

## supplementary materials

---

was separated mechanically and characterized. IR (KBr pellet,  $\text{cm}^{-1}$ ): 2569(Tp, B—H, w), 2483(Bp, B—H, w), 2223(Bp, B—H···Co, w), 1471(s), 1261(s), 1165(s), 1114(s), 999(s), 795(m), 648(m).

### Refinement

Hydrogen atoms of the methyl groups were located on difference Fourier maps, those of the pyrrole fragments were positioned geometrically. For refinement a riding model was used, with C—H = 0.98 Å for methyl H atoms and 0.95 Å for pyrrole H atoms and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  and 1.5  $U_{\text{eq}}(\text{C-methyl})$ . Atom positions and isotropic displacement parameters of B—H hydrogens were refined freely.

### Figures

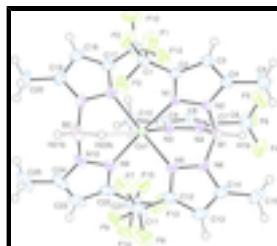

Fig. 1. The molecular structure of the title compound showing the atom-numbering scheme. Displacement ellipsoids are shown at the 50% probability level. H atoms are shown as spheres of arbitrary radius.

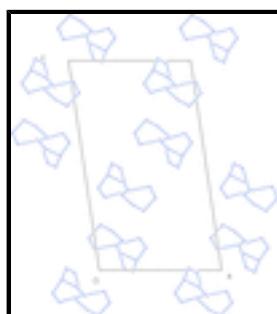

Fig. 2. Projection along the b cell direction of the central core of the molecules of (I), showing the layers parallel to the (1 0 -1) planes.

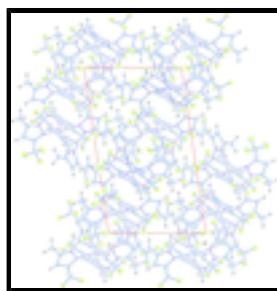

Fig. 3. The crystal structure projected along the b cell direction. H atoms have been omitted for clarity.

0 restraints	$\Delta\rho_{\text{min}} = -0.44 \text{ e \AA}^{-3}$

### *Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
