Received 13 April 2010; accepted 19 April 2010

Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(C-C) = 0.014$ Å;
 R factor = 0.034; wR factor = 0.079; data-to-parameter ratio = 14.8.

The title compound, $[Re_2(C_6H_5Te)_2(CO)_8]$, crystallizes with two molecules in the asymmetric unit, in which two Re atoms are coordinated in a slightly distorted octahedral environment and are bridged by two Te atoms, which show a distorted trigonal-pyramidal geometry. The torsion angles for the Te—Re—Te—Re sequence of atoms are 19.29 (18) and 16.54 (16)° in the two molecules. Thus, the Re—Te four-membered rings in the two molecules deviate significantly from planarity. Two intramolecular C—H···O interactions occur in one of the molecules. Te—Te [4.0551 (10) Å] interactions between the two molecules and weak intermolecular C—H···O interactions stabilize the crystal packing.

Comment

The biological activities of rhenium and tellurium compounds have been studied and revealed interesting and promising applications (Begum *et al.*, 2008; Atwood *et al.*, 1983; Zhang & Leong, 2000). Rhenium derivatives have a wide range of biological applications such as antitumor, cytostatic (Kopf-Maier & Klapotke, 1992) and antitrypanosomal activity (Cerecetto *et al.*, 1997). Organo tellurium compounds are the inhibitors of human cathepsin B, which is a highly predictive indicator for prognosis and diagnosis of cancer. Some of the tellurium derivatives exhibit antioxidant and immunomodulatory effects (Cunha *et al.*, 2009). Recently, a novel organotellurium compound-RT01 was proved to act as antileishmanial agent (Lima *et al.*, 2009). In view of these important features we have chosen the title compound for crystal structure analysis.

The title compound was crystallized with two independent molecules (A & B) in the asymmetric unit (Fig. 1), which adopted dinuclear metallacyclic structure, where each rhenium Re(CO)₄ core is bonded by two phenyl tellurolate groups and hence Re centers attained a distorted octahedral geometry. The r.m.s deviation for four-membered ring with carbonyl atoms of two molecules is 0.016 Å, calculated by Platon - automolfit program (Spek, 2009) and the maximum deviation was observed in phenyl tellurolate groups. The Re—Te bond distances are nearly equal in both the molecules and are similar to those in a related structure (Cecconi *et al.*, 1998). The six atoms (C9A—Te1A—Re2A—Te2A—C15A—Re1A & C15B—Te2B—Re2B—Te1B—C9B—Re1B) generate six-membered rings each with a boat conformation; puckering parameters (Cremer & Pople, 1975) A: q2 = 0.3707(0.0000) Å, q3 = -1.8679(0.0001) Å, phi2 = 113.59 (0.01)°, QT = 1.9043 (0.0001), theta2 = 168.78 (0.00)° and B: q2 = 0.5108(0.0002) Å, q3 = -1.9993(0.0002) Å, phi2 = 125.79(0.02)°, QT = 2.0635(0.0003), theta2 = 165.67(0.01)° . The crystal packing (Fig. 2) of the molecule in the unit cell is influenced by C—H···O and Te—Te interactions. The two molecules in the unit cell are interconnected with each other through Te—Te interaction [4.0551 (10) Å] and illustrated in Fig. 3. This Te···Te separation is similar to that observed previously (Ritch & Chivers, 2009). In their study, weak intermolecular Te···Te contacts were observed in the compound C₃₆H₈₄Cu₃N₃O₃P₆Te₃ ranging from 3.891 Å to 4.039 Å. However, the Te···Te separation observed here is smaller than that in NaCuTe, 4.38 Å, (Seong *et al.*, 1994). Based on these previous studies, the observed Te···Te contact is significant and contributes to the packing. Intermolecular and interatomic O—O bond distances are also observed for O6B—O4B, O5A—O8B, O5A—O4B, O8B—O8B, O5A—O3A, O1B—O5B, O4A—O8A with distances of 2.928 (9) Å, 2.975 (10) Å, 3.025 (9) Å, 3.014 (13) Å, 2.951 (9) Å, 2.9710 (89) Å and 2.9387 (87) Å respectively.

Experimental

A mixture of Re₂(CO)₁₀ (130 mg, 0.2 mmol) and diphenyl ditelluride (41 mg, 0.1 mmol), 4-phenylpyridine (93 mg, 0.6 mmol) were taken in a 50 ml two neck Schlenk flask and fitted with a reflux condenser. The system was evacuated and purged with N₂. Freshly distilled mesitylene (30 ml) was added under N₂ atmosphere. The reaction mixture was heated to 403 K under N₂ for 6 h and allowed to cool to room temperature. The mesitylene was removed by vacuum distillation and the solid mixture was washed with hexane, chromatographed on silica gel using dichloromethane and hexane (1:9) as eluent to obtain the yellow color solid of without phenylpyridine substituted compound [(CO)₄Re(μ -TeC₆H₅)₂Re(CO)₄]. Single

supplementary materials

crystal of the title compound was obtained by slow diffusion of hexane into a concentrated solution of the title compound in dichloromethane at 278 K.

Refinement

The hydrogen atoms were placed in calculated positions ($C—H = 0.95 \text{ \AA}$) and included in the refinement in riding-model approximation with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.034$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.079$	H-atom parameters constrained
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0473P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
8557 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
577 parameters	$\Delta\rho_{\text{max}} = 2.27 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -2.55 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
