Received 24 March 2010; accepted 14 April 2010

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.005$  Å; disorder in main residue;  $R$  factor = 0.044;  $wR$  factor = 0.132; data-to-parameter ratio = 24.4.

The asymmetric unit of the title *triangulo*-triruthenium compound,  $[Ru_3(C_{18}H_{12}Cl_3P)_2(CO)_{10}] \cdot H_2O$ , consists of one *triangulo*-triruthenium complex and one disordered water solvent molecule. Two of the 3-chlorophenyl rings are disordered over two positions with refined site occupancies of 0.671 (3)/0.329 (3) and 0.628 (3)/0.372 (3). The water molecule is disordered over two positions with refined site occupancies of 0.523 (7) and 0.477 (7). Two equatorial carbonyl groups have been substituted by the two monodentate phosphine ligands, leaving one equatorial and two axial carbonyl substituents on the two Ru atoms. The remaining Ru atom carries two equatorial and two axial terminal carbonyl ligands. In the crystal structure, molecules are linked into columns along the  $a$  axis by intermolecular C—H···Cl and C—H···O hydrogen bonds. The molecular structure is stabilized by weak intramolecular C—H···O hydrogen bonds.

### **Comment**

Syntheses and structures of substituted *triangulo*-triruthenium clusters have been of interest to researchers due to observed structural variations and their potential catalytic activity. As part of our ongoing studies of phosphine substituted *triangulo*-triruthenium clusters, we report herein the structure of title compound (I).

The asymmetric unit of title compound (I) consists of one *triangulo*-triruthenium complex and one disordered water solvent (Fig. 1). The geometric parameters of title compound are comparable to those found in a related structure (Chin-Choy *et al.*, 1988). Two monodentate phosphine ligands have replaced carbonyl groups on the Ru1 and Ru2 atoms in the equatorial plane of the Ru<sub>3</sub> triangle. The two ligands are approximately trans to the same Ru–Ru bond with P1–Ru1–Ru3 and P2–Ru2–Ru1 bond angles of 166.40 (2) and 167.38 (2)°, respectively. The P1–Ru1–Ru2–P2 torsion angle is 103.95 (14)°. Unlike the monosubstituted complexes of the type Ru<sub>3</sub>(CO)<sub>11</sub>L [where L = PPh(OMe)<sub>2</sub>, P(OCH<sub>2</sub>CF<sub>3</sub>)<sub>3</sub>] (Bruce *et al.*, 1988b), there is no pronounced difference in the Ru–Ru separations that can be correlated to the presence of the ligand. The Ru–Ru separations are in the range 2.8517 (3) to 2.8645 (3) Å. The differences in the two Ru–P separations are almost identical with those in the analogous complexes synthesized by Bruce *et al.* (1988a). In this complex, the equatorial CO groups are more inclined to preserve linearity, equatorial Ru–C–O angles averaging 176.3° while the average value of the axial Ru–C–O groups is 173.8°.

In the crystal structure, the molecules are linked into columns along the *a* axis by intermolecular C4—H4A···Cl2 and C11—H11A···O8 hydrogen bonds (Fig. 2, Table 1). The molecular structure is stabilized by weak intramolecular C6—H6A···O7 and C24—H24A···O9 hydrogen bonds (Table 1).

### **Experimental**

All the manipulations were performed under a dry oxygen-free nitrogen atmosphere using standard Schlenk techniques. THF was dried over sodium wire and freshly distilled from sodium benzophenone ketyl solution. The title compound (I) was prepared by mixing Ru<sub>3</sub>(CO)<sub>12</sub> (Aldrich) and P(3-Cl-C<sub>6</sub>H<sub>4</sub>)<sub>3</sub> (Maybridge) in a 1:2 molar ratio in THF at 40 °C. About 0.2 ml of diphenylketyl radical anion initiator (synthesized as per the method of Bruce *et al.*, 1987) was introduced into the reaction mixture under a current of nitrogen. After 20 min. of stirring, the solvent was removed under vacuum. Separation of the product in the pure form was done by preparative thin layer chromatography (mobile phase, dichloromethane: hexane, 1:3) and major red band was separated. Spectroscopic analyses, IR (cyclohexane): v(CO) 2081, 2059, 2041, 2028, and 2002 cm<sup>-1</sup>. <sup>1</sup>H-NMR (CDCl<sub>3</sub>, δ): 7.23–7.55 (m, aromatic protons). Single crystals of I (m.p. 159–162 °C) were grown by slow diffusion from dichloromethane: methanol at 10 °C

## Refinement

All hydrogen atoms were positioned geometrically and refined using a riding model with C–H = 0.93 Å,  $U_{\text{iso}}(\text{H})$  = 1.2  $U_{\text{eq}}(\text{C})$  and O–H = 0.85 Å,  $U_{\text{iso}}(\text{H})$  = 1.5  $U_{\text{eq}}(\text{O})$ . Two of the 3-chlorophenyl rings (Cl3/C13–C18 and Cl5/C25–C30) are disordered over two positions with refined site-occupancies of 0.671 (3)/0.329 (3) and 0.628 (3)/0.372 (3), respectively. These disordered benzene rings were subjected to rigid bond and similarity restraints. The same  $U_{ij}$  parameters were used for the atom pairs C15A/C15B. The water molecule is also disordered over two positions with refined site-occupancies of 0.523 (7) and 0.477 (7). The O atom of the disordered water molecule was refined isotropically. The maximum and minimum residual electron density peaks were located 1.79 Å and 0.39 Å from the H1WA and Cl6 atoms, respectively.

## Figures

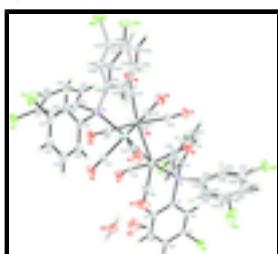

Fig. 1. The molecular structure of the title compound with 50% probability ellipsoids for non-H atoms.

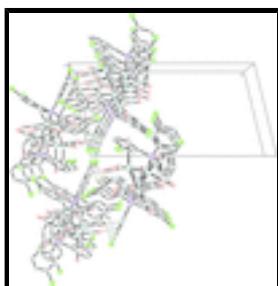

Fig. 2. The crystal packing of (I), viewed down the  $a$  axis, showing the molecules linked into columns along  $a$  axis. Hydrogen atoms not involved in the hydrogen-bonding (dashed lines) and the solvent molecules have been omitted for clarity.

301 restraints	$\Delta\rho_{\min} = -1.17 \text{ e \AA}^{-3}$

*Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
