

## N-[Bis(dimethylamino)phosphinoyl]-2,2,2-trichloroacetamide

Oleksiy V. Amirkhanov,\* Olesia V. Moroz, Kateryna O. Znoviyak, Elizaveta A. Trush and Tetyana Yu. Sliva

Kyiv National Taras Shevchenko University, Department of Chemistry, Volodymyrska str. 64, 01601 Kyiv, Ukraine

Correspondence e-mail: amirkhalex@gmail.com

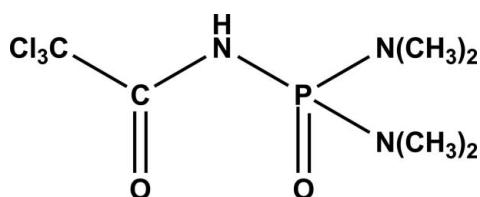

Received 12 April 2010; accepted 13 April 2010

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.001\text{ \AA}$ ;  $R$  factor = 0.030;  $wR$  factor = 0.072; data-to-parameter ratio = 39.1.

In the title compound,  $\text{C}_6\text{H}_{13}\text{Cl}_3\text{N}_3\text{O}_2\text{P}$  or  $\text{CCl}_3\text{C}(\text{O})\text{NH}-\text{P}(\text{O})(\text{N}(\text{CH}_3)_2)$ , the phosphinoyl group is synclinal to the carbonyl group and acts as an acceptor for an intermolecular  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bond from the amide group as the donor.

### N-[Bis(dimethylamino)phosphinoyl]-2,2,2-trichloroacetamide

**O. V. Amirkhanov, O. V. Moroz, K. O. Znovjyak, E. A. Trush and T. Y. Sliva**

#### Comment

P, N-substituted analogues of  $\beta$ -diketones – carbacylamidophosphates (CAPh), which comprise C(O)NHP(O) structural fragment, have attracted attention because of their using in pharmacology, as insecticides, pesticides and ureas inhibitor (Adams *et al.*, 2002; Grimes *et al.*, 2008). A variety of new coordination compounds with s-, p-, d- and f-metals based on the CAPh have been synthesized and characterized up to date (Skopenko *et al.*, 2004; Znovjyak *et al.*, 2009a). Thus, the syntheses and structure analysis of CAPh have been of increased interest (Gholivand *et al.*, 2008a). In this paper we report the crystal structure of a new CAPh – *N*-[bis(dimethylamino)phosphinoyl]-2,2,2-trichloroacetamide (**1**).

In the crystal packing molecules of **1** are linked to each other by intermolecular hydrogen bonds (N–H $\cdots$ O), where amide nitrogen atom of one molecule acts as donor and oxygen atom of phosphinoyl group of neighboring molecule acts as acceptor (Fig. 2). The bond distance P(1)—O(1) (1.478 (1) Å) is typical for compounds with amide substituents close to phosphorus atoms (Rebrova *et al.*, 1982) and CAPh (Znovjyak *et al.*, 2009b). The values of C(1)—O(2) and C(1)—N(1) are 1.215 (1) Å and 1.355 (1) Å, respectively and close to the corresponding values of the CAPh (Gholivand *et al.*, 2008b). The P(1)—N(1) (1.714 (1) Å) distance in **1** is longer on average by 0.08 Å than P—N bond distances between amide substituents and phosphorus atoms (P(1)—N(2), P(1)—N(3)). The geometry around the phosphorus atom in **1** can be described as a distorted tetrahedron and which is similar to early reported CAPh. The O(1)—P(1)—N(1) angle value is close to near tetrahedral one (109.61 (4) $^\circ$ ), while other O—P—N angels have values 113.19 (4) $^\circ$  and 116.53 (4) $^\circ$ , that may be explained by the repulsion between amide substituents and PO group. Fragment O(2)—C(1)—N(1)—P(1) is close to planarity (the torsion angle is -176.6 $^\circ$ ).

#### Experimental

The dichloranhydride of trichloroacetylaminodiphosphoric acid ( $\text{CCl}_3\text{C}(\text{O})\text{NHP}(\text{O})\text{Cl}_2$ ) was prepared according to the method reported by Kirsanov (Kirsanov *et al.*, 1956).

The dioxane solution (200 ml) of  $\text{CCl}_3\text{C}(\text{O})\text{NHP}(\text{O})\text{Cl}_2$  (27.9 g, 0.1 mol) was placed in a three-neck round-bottomed flask and cooled by ice to 268 K. Then the dry dimethylamine (18.03 g, 0.4 mol) was bubbled through the dioxane solution of  $\text{CCl}_3\text{C}(\text{O})\text{NHP}(\text{O})\text{Cl}_2$  under stirring until the solution became alkaline. The temperature was not allowed to rise above 278 K. The stirring was continued for 1 h and the solution was left under ambient conditions.  $\text{HN}(\text{CH}_3)_2\cdot\text{HCl}$  was filtered off after 12 h and the filtrate was evaporated. The oily precipitate of **1** was isolated and recrystallized from 2-propanol which led to formation of white crystalline powder (yield 80%). White needle-shaped crystals suitable for X-ray analysis were formed over a period of 5 days from the 2-propanol/hexane solution. IR (KBr pellet,  $\text{cm}^{-1}$ ): 3070 (v(NH)), 1715 (v(CO)), 1205 (v(PO)), 1000 (v(PN<sub>amine</sub>)), 867 (v(PN<sub>amide</sub>)), 676 (v(CCl)).

---

## Refinement

Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

## Figures

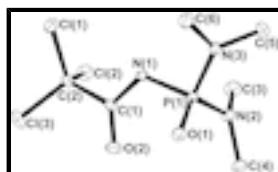

Fig. 1. Structural representation of **1** with atom numbering scheme and 50% probability thermal ellipsoid. The hydrogen atoms are omitted for clarity.

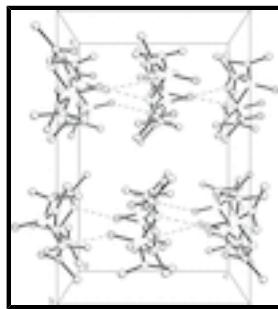

Fig. 2. A projection of packing diagram of the title compound along the y direction. Hydrogen bonds are indicated by dashed lines. H and Cl atoms are omitted for clarity.

 $w = 1/[\sigma^2(F_o^2) + (0.0336P)^2 + 0.5268P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.46 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\min} = -0.40 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
