Key indicators: single-crystal X-ray study; $T = 113\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.041; wR factor = 0.099; data-to-parameter ratio = 16.4.

In the title compound, $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}$, the azetidine ring (r.m.s. deviation = 0.021 Å) and the oxetane ring (r.m.s. deviation = 0.014 Å) are nearly perpendicular to each other [dihedral angle = 89.7 (1)°]. The azetidine ring is twisted out of the plane of the benzene ring by 18.3 (1)°. In the crystal structure, molecules are linked to form chains along the c axis by C—H···O hydrogen bonds.

Related literature

The title compound is a key intermediate to synthesize (pyrrolo[3,4-*c*]pyrazol-3-yl)benzamide derivatives. For the anti-tumor effect of these derivatives, see: Fancelli *et al.* (2005).

4-(2-Oxa-6-azaspiro[3.3]hept-6-yl)benzonitrile

J. Li, T. Xu, P.-B. Wu, J. Lu and Y. Tang

Experimental

A DMSO solution of 2-oxa-6-azaspiro[3,3]heptane (0.99 g, 0.01 mol) with 4-fluorobenzonitrile (1.21 g, 0.01 mol) was heated to reflux for 5 h, then water (100 ml) was added into the solution. The mixture was extracted with CH₂Cl₂. Then the solvent was removed to give a red powder. Single crystals were obtained from a CH₂Cl₂ solution after 3 days.

Refinement

H atoms were placed in the calculated positions (C—H = 0.95–0.99 Å) and refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
