Received 19 March 2010; accepted 14 May 2010

Key indicators: single-crystal X-ray study; $T = 123\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.041; wR factor = 0.135; data-to-parameter ratio = 16.0.

The Pd^{II} atom in the title compound, $[\text{Pd}(\text{C}_2\text{F}_3\text{O}_2)(\text{C}_{24}\text{H}_{43}\text{P}_2)]$, adopts a distorted square-planar geometry with the P atoms in a *trans* arrangement, forming two five-membered chelate rings. Four intramolecular C—H···O hydrogen bonds occur. The crystal packing reveals one weak intermolecular C—H···O hydrogen bond, which self-assembles the molecules into infinite chains parallel to the *b* axis.

[2,6-Bis(di-*tert*-butylphosphinomethyl)phenyl- κ^3P,C^1,P'](trifluoroacetato)palladium(II)

M. T. Johnson, M. Cetina, K. Rissanen and O. F. Wendt

Comment

The title compound (I) was prepared by cyclometallation of 1,3-[bis(ditertbutylphosphino)methyl]benzene (Johansson *et al.*, 2005). Our research has been directed towards carbon dioxide insertion into a series of compounds where compound (I) acts as a starting material for their synthesis (Johansson *et al.*, 2005; Johansson & Wendt, 2007).

The palladium atom in compound (I) exhibits a distorted square-planar geometry with the phosphorus atom coordinated trans to each other with a P1—Pd—P2 angle of 166.82 (4) $^\circ$ (Fig. 1). Coordination of the (PCP)-tridentate ligand leads to the formation of two five-membered rings. The Pd—O1 bond of 2.143 (3) Å is slightly elongated compared to its palladium acetate analogue with a Pd—O1 distance of 2.128 (2) Å (Johansson *et al.* 2005). This is as expected for a more electron deficient ligand. The Pd—P distances, Pd—P1 = 2.305 (1) Å and Pd—P2 = 2.317 (1) Å do not differ significantly. The P1—C2—C6—P2 torsion angle of +/-10.9 (3) $^\circ$ is similar to other PCPPd complexes. There are four moderate C—H···O intramolecular hydrogen bonds (Table 1). The angle between the least-squares planes through the trifluoroacetate atoms O1,O2,C25 and C26 and the phenyl ring is 73.5 (2) $^\circ$. The deviation from the perpendicular orientation is caused by the C3—H3···O2ⁱ hydrogen bond (Fig. 2; Table 1), which self-assembles the molecules of (I) into infinite chains parallel to the *b* axis.

Experimental

The title compound was prepared according to a literature procedure (Johansson *et al.*, 2005).

Refinement

All hydrogen atoms were included in calculated positions as riding atoms, with C—H = 0.95 Å for aromatic hydrogen atoms, 0.98 Å for methyl hydrogen atoms and 0.99 Å for methylene hydrogen atoms. The hydrogen atom U_{iso} parameters were set at 1.5U_{eq} for the methyl hydrogen atoms, and 1.2U_{eq} for all other hydrogen atoms.

Because of the bias in the data the C25 atom could not be refined anisotropically satisfactorily. Therefore, EADP constraint was applied in the refinement equalizing C25 with C26 atom. This results in high electronic density of 1.912 e Å⁻³ near C25 probably indicating some disorder or partial occupancy of another atom.

Refinement

Refinement on F^2

Primary atom site location: structure-invariant direct methods

Least-squares matrix: full

Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.041$

Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.135$

H-atom parameters constrained

$S = 0.98$

$$w = 1/[\sigma^2(F_o^2) + (0.082P)^2 + 22.4388P]$$

where $P = (F_o^2 + 2F_c^2)/3$

5002 reflections

$(\Delta/\sigma)_{\max} < 0.001$

313 parameters

$\Delta\rho_{\max} = 1.91 \text{ e \AA}^{-3}$

0 restraints

$\Delta\rho_{\min} = -1.12 \text{ e \AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
