Bis[4-amino-N-(pyrimidin-2-yl)benzenesulfonamido](2,2'-bipyridine)manganese(II)

Comment

In the title compound, $[\text{Mn}(\text{sdz})_2(\text{bpy})]$ (where sdz is the sulfadiazine anion and bpy is 2,2'-bipyridine), the Mn(II) ion has six-coordinated distorted octahedral geometry and contains two bidentate N-coordinated sulfadiazinate anions and one chelating 2,2'-bipyridine ligand. The coordination mode of sulfadiazine is similar to its cobalt(II) complex (Ajibade *et al.*, 2006; Wang *et al.* 2010), nickel(II) complex (Wang *et al.* 2009), and copper(II) complex (Brown *et al.*, 1987), but different from $\text{Zn}(\text{sdz})_2$ (Yuan *et al.*, 2001), polymeric Cd(II) complex (Wang *et al.* 2005), and its copper complex (Hossain *et al.* 2006). The Mn—N bond distances involving the sulfonamide atoms N1, N5, the pyrimido atoms N2, N6, and the 2,2'-bipyridine atoms N9, N10, are very similar, at 2.242 (4), 2.234 (4), 2.312 (4), 2.278 (4), 2.235 (4), 2.225 (4) Å, respectively. The bond distances of the chelating bpy to Mn(II), Mn—N are consistent with those for the reported bpy-Mn(II) complexes, e.g. diazidobis(2,2'-bipyridine)manganese(II) (Mn —N 2.322 (3) Å)(Cheng *et al.*, 2004) and tris(2,2'-bipyridine)manganese(II) perchlorate hemihydrate (Mn —N 2.214 (4)-2.294 (4) Å)(Chen *et al.*, 1995). The tetrahedral coordination at S is distorted, also found in the neutral sulfadiazine molecule. A three dimensional network is generated via N—H···N, N—H···O, C—H···O hydrogen bonds from the sulfadiazine ligands of the complex.

Experimental

0.1 mmol $\text{Mn}(\text{CH}_3\text{COO})_2 \cdot 4\text{H}_2\text{O}$, 0.2 mmol sulfadiazine, 0.1 mmol 2,2'-bipyridine, ethanol (1 ml), methanol (1 ml) and pyridine (0.1 ml) were placed in a Pyrex tube (ca 25 cm). The tube was frozen with liquid N_2 , evacuated under vacuum, sealed with a torch and heated at 353 K for three days to give yellow block-shaped crystals, with a yield of 70%.

Refinement

The carbon H atoms were treated as riding, with C—H distances of 0.95 Å, and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. The H atoms attached to the amino N atoms were located in an electron-density map and refined isotropically.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
