Received 27 April 2010; accepted 26 May 2010

Key indicators: single-crystal X-ray study; $T = 200$ K; mean $\sigma(C-C) = 0.009$ Å; disorder in main residue; R factor = 0.032; wR factor = 0.046; data-to-parameter ratio = 16.5.

The title compound, $[Rh(C_8H_{12})(C_{14}H_{28}P_2)]BF_4$, exhibits a rhodium(I) complex cation with a bidentate bisphosphine ligand and a bidentate η^2,η^2 -coordinated cycloocta-1,5-diene. Together the ligands create a slightly distorted square-planar coordination environment for the Rh(I) atom. There are three molecules in the asymmetric unit and intramolecular P–Rh–P bite angles of 82.78 (5), 82.97 (6) and 83.09 (5)° are observed. The dihedral angles between the P–Rh–P and the X –Rh– X planes (X is the centroid of a double bond) are 14.7 (1), 14.8 (1) and 15.3 (1)°. The structure exhibits disorder of one cyclooctadiene ligand as well as one BF_4^- anion.

(+)-{1,2-Bis[(2*R*,5*R*)-2,5-dimethylphospholan-1-yl]ethane- κ^2P,P' }(η^4 -cycloocta-1,5-diene)rhodium(I) tetrafluoridoborate

S. Schulz, H.-J. Drexler and D. Heller

Comment

In the course of our studies on structures of cationic rhodium bisphosphine diolefin complexes (Drexler *et al.*, 2004), we became interested in the chiral ligand family of 1,2-bis(2,5-dialkylphospholano)ethane, that build up five-membered ring chelates with rhodium (see: figure 1).

The title compound $[\text{Rh}((R,R)\text{-Me-BPE})\text{COD}]\text{BF}_4$ can be easily synthesized by an cycloocta-1,5-diene (COD) exchange of $[\text{Rh}(\text{COD})_2]\text{BF}_4$ with the chiral bisphosphine ligand (*R,R*)-Me-BPE (Schrock & Osborn, 1971) or an exchange of acetylacetone (acac) by the bisphosphine in the presence of HBF_4 starting from the precursor $[\text{Rh}(\text{acac})(\text{COD})]$ (Fennis *et al.*, 1990).

Usually, the five-membered ring chelate is flexible and λ - or δ -conformers would be anticipated (Fernandez *et al.*, 2000). For the title compound the molecular structure of the three molecules in the asymmetric unit exclusively show δ -conformation of the bisphosphine backbones. COD ligands are η^2,η^2 -coordinated and are orientated in an anticlockwise twist manner for all molecules (see: figure 2). This means that the double bonds of COD are not coordinated perpendicular to the $\text{P},\text{Rh},\text{P}$ plane. The dihedral angles between the planes of $\text{P},\text{Rh},\text{P}$ and of $\text{X},\text{Rh},\text{X}$ (X = centroid of the double bond) are 14.8 (1) $^\circ$ (Rh1), 14.7 (1) $^\circ$ (Rh2) and 15.3 (1) $^\circ$ (Rh3). These dihedral angles are comparable to those in the corresponding Me-BPE complex $[\text{Rh}((R,R)\text{-Me-BPE})\text{COD}]\text{SbF}_6$ (19.4 $^\circ$) (Burk *et al.*, 1990; Drexler *et al.*, 2004) or for the Me-DuPhos complexes ($[\text{Rh}((S,S)\text{-Me-DuPhos})\text{COD}]\text{BF}_4$: 16.4 $^\circ$, Drexler *et al.*, 2004; $[\text{Rh}((S,S)\text{-Me-DuPhos})\text{COD}]\text{SbF}_6$: 17.8 $^\circ$, Drexler *et al.*, 2004; Burk *et al.*, 1993).

Intramolecular P—Rh—P angles of 82.78 (5) $^\circ$, 82.97 (6) $^\circ$ and 83.09 (5) $^\circ$ were obtained. They are in the same range as those of corresponding complexes already described in the literature ($[\text{Rh}((R,R)\text{-Me-BPE})\text{COD}]\text{SbF}_6$: 83.25 (6) $^\circ$, Burk *et al.*, 1990; $[\text{Rh}((R,R)\text{-Et-DuPhos})\text{COD}]\text{BF}_4$: 85.32 (6) $^\circ$, Drexler *et al.*, 2001) exclusively for the complex $[\text{Rh}((R,R)\text{-iPr-BPE})\text{COD}]\text{SbF}_6$ with an bite angle of 95.18 (9) $^\circ$ (Burk *et al.*, 1991).

Experimental

By overlaying a solution of $[\text{Rh}((R,R)\text{-Me-BPE})\text{COD}]\text{BF}_4$ in dichloromethane with MTBE (methyl-*tert*-butylether) red-orange single crystals suitable for X-ray analysis are obtained. ^{31}P NMR (CD_2Cl_2 , 298 K, 122 MHz) [ppm]: 77.0 (d, $J_{\text{P}-\text{Rh}} = 146.0$ Hz).

Refinement

All non-hydrogen atoms are refined anisotropically, except not fully occupied non-hydrogen atoms of one anion and one COD, which are disordered. Distance restraints were used to improve the geometry of the respective anions and COD

supplementary materials

ligands. All H atoms were placed in idealized positions with $d(C—H) = 0.99$ (CH_2), 0.98 (CH_3) and 1.0 Å (CH) and refined using a riding model with $U_{\text{iso}}(\text{H})$ fixed at 1.5 $U_{\text{eq}}(\text{C})$ for CH_3 and 1.2 $U_{\text{eq}}(\text{C})$ for CH_2 and CH .

Figures

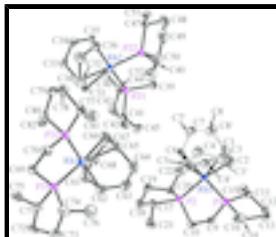

Fig. 1. Perspective view and numbering scheme of the three cations $[\text{Rh}((R,R)\text{-Me-BPE})\text{COD}]^+$ in the asymmetric unit (30% probability displacement ellipsoids). All hydrogens and anions have been omitted for clarity.

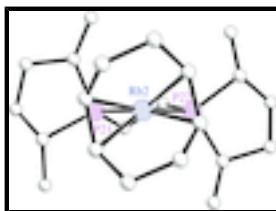

Fig. 2. Front view, perspective diagram of one cation $[\text{Rh}((R,R)\text{-Me-BPE})\text{COD}]^+$ showing the anticlockwise twist of the cycloocta-1,5-diene ligand.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.032$	H-atom parameters constrained
$wR(F^2) = 0.046$	$w = 1/[\sigma^2(F_o^2) + (0.P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.87$	$(\Delta/\sigma)_{\max} = 0.005$
13252 reflections	$\Delta\rho_{\max} = 0.37 \text{ e } \text{\AA}^{-3}$
804 parameters	$\Delta\rho_{\min} = -0.28 \text{ e } \text{\AA}^{-3}$
77 restraints	Absolute structure: Flack (1983), 5822 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: -0.03 (2)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
