## 3,5-Dicarboxy-2,6-dimethylpyridinium chloride dihydrate

## Ji-Yuan Yao

Ordered Matter Science Research Center, College of Chemistry and Chemical, Engineering, Southeast University, Nanjing 210096, People's Republic of China Correspondence e-mail: yaojiyuan520@163.com

Received 5 May 2010; accepted 12 May 2010

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.044 ; w R$ factor $=0.120$; data-to-parameter ratio $=14.9$.

In the title compound, $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{NO}_{4}{ }^{+} \cdot \mathrm{Cl}^{-} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, both the cation and the anion have crystallographic twofold rotation symmetry; in the former, one N and one C atom lie on the rotation axis. In the crystal structure, the ions and water molecules are linked via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}, \mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{N}-$ $\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds into layers parallel to (101).

## 3,5-Dicarboxy-2,6-dimethylpyridinium chloride dihydrate

## J.-Y. Yao

## Comment

Organic and inorganic complexes or salts can develop supramolecular structures via multiple hydrogen-bonding systems by self-assembly of components which contain abundant hydrogen-bonding sites (Rowan \& Holt, 1997). The present study is a part of systematic investigation of ferroelectric materials (Ye et al., 2008; Hang et al., 2009) that include metal-organic coordination compounds with organic ligands or compounds whose structures consist both of organic and inorganic building fragments.

The asymmetric unit of the title compound is composed of a half of a 3,5-dicarboxy-2,6-dimethylpyridinium cation, a half of a chloride anion and a water molecule. Both cation and anion have crystallographically imposed twofold rotation symmetry (Fig. 1). In the cation, the $\mathrm{C}-\mathrm{O}$ bond lengths in the carboxylic group ( $\mathrm{C} 1-\mathrm{O} 1=1.300(2) \AA$; $\mathrm{C} 1-\mathrm{O} 2=1.218$ (2) $\AA$ ) conform to the expected values (Allen, 2002). The C3—N1—C3 angle of $126.6(2){ }^{\circ}$ corresponds closely to the average value found in protonated pyridinium ions (122.0 (2) ${ }^{\circ}$ ). In the crystal structure (Fig. 2), the 3,5-dicarboxy-2,6-dimethylpyridinium cations, the chloride anions and the water molecules are linked via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}, \mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds (Table 1) to form two-dimensional layers parallel to the (101) plane. Dielectric studies (capacitance and dielectric loss measurements) were performed on powder samples of the title compound pressed into tablets on the surfaces of which a conducting carbon glue was deposited. The automatic impedance TongHui 2828 Analyzer has been used. In the measured temperature ranges ( 80 to 480 K , m.p. $>480 \mathrm{~K}$ ), the structure showed no dielectric anomaly.

## Experimental

2,6-Dimethylpyridine-3,5-dicarboxylic acid ( $1.95 \mathrm{~g}, 10 \mathrm{mmol}$ ) and concentrated hydrochloric acid ( 10 mmol ) were dissolved in methanol ( 25 ml ). The solution was filtered and left at room temperature for 5 days. Colourless crystals suitable for X-ray analysis were obtained by slow evaporation of the solvent.

## Refinement

The pyridinium and water H atoms were located in a difference Fourier map and refined freely. All other H atoms were calculated geometrically and allowed to ride on their parent atoms, with $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA, \mathrm{O}-\mathrm{H}=0.82 \AA$, and with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{C}, \mathrm{O})$ or $1.2 U_{\mathrm{eq}}(\mathrm{C})$ for the aromatic H atom.

## supplementary materials

Figures

Fig. 1. The molecular structure of the title compound, showing the atomic numbering scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level. Atoms with suffix A are generated by the symmetry operation ( $2-\mathrm{x}, \mathrm{y}, 0.5-\mathrm{z}$ ).

## Refinement

## Refinement on $F^{2}$

Least-squares matrix: full

Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.044$
$w R\left(F^{2}\right)=0.120$
$S=1.11$
1353 reflections
91 parameters
0 restraints

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0618 P)^{2}+0.5934 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\max }=0.26$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.21$ e $\AA^{-3}$

## Special details

Geometry. All esds (except the esd in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor wR and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$ factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
