Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.048; wR factor = 0.128; data-to-parameter ratio = 15.8.

In the title compound, $\text{C}_{19}\text{H}_{13}\text{N}_3\text{O}_3\text{S}\cdot 0.5\text{H}_2\text{O}$, both organic molecules (A and B) exist in E configurations with respect to the acyclic $\text{C}=\text{N}$ bond and have similar overall conformations. In molecule A , the essentially planar thiazole ring [maximum deviation = 0.010 (2) \AA] is inclined at interplanar angles of 11.44 (10) and 32.50 (12) $^\circ$, with the 2*H*-chromene ring system and the benzene ring, respectively. The equivalent values for molecule B are 0.002 (2) \AA , 7.71 (9) and 12.51 (12) $^\circ$. In the crystal structure, neighbouring molecules are interconnected into infinite layers lying parallel to (010) by $\text{O}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{N}$, $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds. Further stabilization of the crystal structure is provided by weak intermolecular $\text{C}-\text{H}\cdots\pi$ and $\pi-\pi$ [centroid–centroid distance = 3.6380 (19) \AA] interactions.

3-{2-[3-Hydroxybenzylidene]hydrazin-1-yl}-1,3-thiazol-4-yl}-2H-chromen-2-one hemihydrate

A. Arshad, H. Osman, K. L. Chan, J. H. Goh and H.-K. Fun

Comment

The biological activity of aminothiazoles is well documented. Some of these compounds exhibit very good anti-fungal (Hiremath *et al.*, 1992), anti-bacterial (Habib & Khalil, 1984), anti-tuberculosis (Gursoy & Karah, 2000; Karah *et al.*, 1998) and anti-tumor (Wattenberg *et al.*, 1979) activities. They also have broad applications in the treatment of allergies, Schizophrenia (Ohkuba *et al.*, 1995), inflammation (Jayashree *et al.*, 2005) and hypertension (Patt *et al.*, 1992). Besides that, coumarin and its derivatives also possess significant anti-bacterial (Mitscher, 2002; Laffitte *et al.*, 2002), anti-fungal (Moffett, 1964) and cytotoxic (Weber *et al.*, 1998) activities. They also have pronounced medicinal value as anti-coagulants (Anderson *et al.*, 2002; Tassies *et al.*, 2002), free radical scavengers (Finn *et al.*, 2004), lipoxygenase and cyclooxygenase inhibitors (Kimura *et al.*, 1985, Hofmanová *et al.*, 1998). The title compound, (I) was synthesized by incorporating aminothioazole moiety to a coumarin skeleton and here we present its crystal structure.

The asymmetric unit of the title compound (Fig. 1) comprises of two crystallographically independent 3-{2-[3-hydroxybenzylidene]hydrazinyl}thiazol-4-yl}-2H-chromen-2-one molecules and a water molecule of crystallization. Both of the independent molecules exist in *cis* configurations with respect to the acyclic N3=C13 double bond. A superposition of the non-H atoms of molecules *A* and *B* (Fig. 2) using *XP* in *SHELXTL* (Sheldrick, 2008), gave an r.m.s. deviation of 0.447 Å.

In each molecule, the thiazole ring (C10/C11/S1/C12/N1) is essentially planar, with maximum deviations of -0.010 (2) and 0.002 (2) Å, respectively, for atoms C11A of molecule *A* and C12B of molecule *B*. In molecule *A*, the thiazole ring is inclined at interplanar angles of 11.44 (10) and 32.50 (12)°, respectively, with respect to the 2*H*-chromene ring system (C1A-C9A/O1A) and C14A-C19A benzene ring; the comparable angles for molecule *B* are 7.71 (9) and 12.51 (12)°, respectively. The bond lengths and angles are comparable to those observed in closely related structures (Arshad *et al.*, 2010*a,b*).

In the crystal structure (Fig. 3), neighbouring molecules are interconnected into two-dimensional infinite networks parallel to the (010) plane by intermolecular O3A—H3OA···O3B, N2A—H2NA···O1W, O3B—H3OB···O2B, N2B—H2NB···O2A, O1W—H1W1···N1B, O1W—H2W1···N1A and C8A—H8A···O1W hydrogen bonds (Table 1). The crystal structure is further stabilized by weak intermolecular C5B—H5B···Cg1 interactions (Table 1) involving the centroid of C14A—C19A benzene ring as well as Cg2···Cg3 aromatic stacking interactions [Cg2···Cg3 = 3.6380 (19) Å, symmetry code: -x+1, -y, -z+1 where Cg2 and Cg3 are the centroids of benzene (C14B-C19B) and 2*H*-pyran (C1B/O1B/C2B/C7B/C8B/C9B) rings].

Experimental

3-Hydroxybenzaldehyde thiosemicarbazone (Lv *et al.*, 2010) and 3-[ω -bromoacetyl coumarin] (Siddiqui *et al.*, 2009) were synthesized as reported in the literatures. A solution of 3-[ω -bromoacetyl coumarin] (2.5 mmol) and 3-hydroxybenzaldehyde thiosemicarbazone (2.5 mmol) in chloroform-ethanol (2:1) was refluxed for 1 h at 353 K. A clear solution was formed followed by the deposition of thick yellow precipitates. The reaction mixture was cooled and basified with ammonia. The

supplementary materials

title compound, (I) was purified and recrystallized as shiny yellow plates of (I) from ethanol-ethyl acetate (1:2); the water of crystallisation was presumably incorporated from the atmosphere.

Refinement

The H atoms bound to O and N atoms were located from the difference Fourier map and constrained to ride with the parent atom with $U_{\text{iso}} = 1.5 U_{\text{eq}}(\text{O})$ or $U_{\text{iso}} = 1.2 U_{\text{eq}}(\text{N})$. All other H atoms were placed in their calculated positions, with C—H = 0.93 Å, and refined using a riding model, with $U_{\text{iso}} = 1.2 U_{\text{eq}}(\text{C})$.

Figures

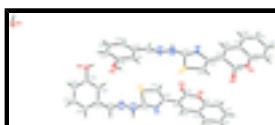

Fig. 1. The molecular structure of (I), showing 50 % probability displacement ellipsoids for non-H atoms.

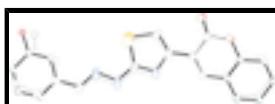

Fig. 2. Fit of molecule *A* (dashed lines) on molecule *B* (solid lines). H atoms have been omitted for clarity.

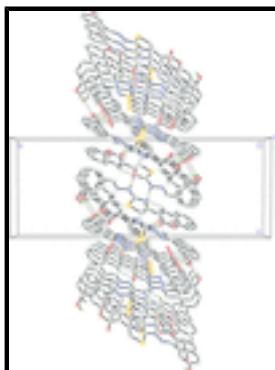

Fig. 3. The crystal structure of (I), viewed along the *a* axis, showing a two-dimensional infinite network parallel to the (010) plane. H atoms not involved in intermolecular interactions (dashed lines) have been omitted for clarity.

0 restraints	$\Delta\rho_{\text{min}} = -0.31 \text{ e \AA}^{-3}$

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1)K.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
