

## 2,2',6,6'-Tetraethyl-4,4'-methylene-dibenzonitrile

Jingjing Yuan\* and Yanping Zhu

Key Laboratory of Pesticides and Chemical Biology of the Ministry of Education, College of Chemistry, Central China Normal University, Wuhan 430079, People's Republic of China  
Correspondence e-mail: jingjingyuan0503@163.com

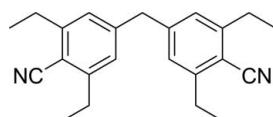

Received 9 May 2010; accepted 27 May 2010

Key indicators: single-crystal X-ray study;  $T = 290\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.038;  $wR$  factor = 0.111; data-to-parameter ratio = 17.6.

The asymmetric unit of the title compound,  $\text{C}_{23}\text{H}_{26}\text{N}_2$ , contains one half-molecule, which is completed by the operation of a crystallographic twofold axis. In the molecule, the two benzene rings form a dihedral angle of  $77.09(7)^\circ$ .

## 2,2',6,6'-Tetraethyl-4,4'-methylenedibenzonitrile

J. Yuan and Y. Zhu

### Comment

Aromatic nitriles are important intermediates in the synthesis of pharmaceuticals, agrochemicals, herbicides, dyes and pigments, and serve as precursors for many useful compounds including benzoic acid derivatives, benzylamines, benzaldehydes, and heterocycles (Debasree *et al.*, 2009; Lal Dhar *et al.*, 2009; Ren *et al.*, 2009; Zhou *et al.*, 2009).

In this paper, we report the synthesis and crystal structure of the title compound (Fig. 1). In the molecule, two benzene rings form a dihedral angle of  $77.09(7)^\circ$ , and N···N separation is  $11.67(3)\text{\AA}$ . The crystal packing doesn't exhibit hydrogen bonds or classical interactions.

### Experimental

The title compound has been synthesized following the known procedure (Donald *et al.*, 1955). To an ice-bath cooled solution of 4,4'-methylenebis(2,6-diethylaniline) and sodium nitrite in water was added dropwise concentrated hydrogen chloride, keeping the temperature at  $0\text{--}5^\circ\text{C}$  for 30 minutes. Then added potassium iodide into the mixed solution, and the white solid bis(3,5-diethyl-4-iodophenyl)methane was obtained. It reacted with cyanocupper in DMF solution at  $180^\circ\text{C}$  for 1 hour, then the title compound was obtained. X-ray quality crystal of the title compound was obtained by slow evaporation from chloroform solution at room temperature.

### Figures

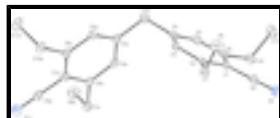

Fig. 1. A view of (I), showing the atom-labelling scheme and 40% probability displacement ellipsoids [symmetry code: (a)  $-x, y, 1/2-z$ ]. H atoms omitted for clarity.

$Z = 4$

## Data collection

Bruker SMART 4K CCD area-detector diffractometer	1405 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}} = 0.028$
graphite	$\theta_{\text{max}} = 27.0^\circ$ , $\theta_{\text{min}} = 3.2^\circ$
phi and $\omega$ scans	$h = -20 \rightarrow 20$
8636 measured reflections	$k = -11 \rightarrow 11$
2055 independent reflections	$l = -17 \rightarrow 17$

## Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.038$	H-atom parameters constrained
$wR(F^2) = 0.111$	$w = 1/[\sigma^2(F_o^2) + (0.0506P)^2 + 0.6433P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.16$	$(\Delta/\sigma)_{\text{max}} = 0.003$
2055 reflections	$\Delta\rho_{\text{max}} = 0.24 \text{ e \AA}^{-3}$
117 parameters	$\Delta\rho_{\text{min}} = -0.20 \text{ e \AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0066 (13)

## Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
