Received 17 May 2010; accepted 28 May 2010

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.043;  $wR$  factor = 0.130; data-to-parameter ratio = 10.0.

In the title compound,  $\text{C}_{30}\text{H}_{26}\text{N}_2\text{O}_3$ , the two pyrrolidine rings adopt twisted and envelope conformations, whereas the cyclopentane ring adopts an envelope conformation. The least-squares planes through the pyrrolidine rings form a dihedral angle of  $41.72(10)^\circ$ . The molecular structure is stabilized by an intramolecular  $\text{O}-\text{H}\cdots\text{N}$  hydrogen bond, which generates an *S*(5) ring motif. Centrosymmetrically related molecules are linked via two pairs of intermolecular  $\text{C}-\text{H}\cdots\text{O}$  interactions, forming  $R_2^2(16)$  ring motifs. In the crystal packing, the molecules are linked into two-dimensional networks parallel to the *ab* plane via  $\text{C}-\text{H}\cdots\text{O}$  interactions.

### Comment

The cycloaddition reaction of azomethine ylide 1,3-dipoles with olefinic dipolarophiles constitutes a straightforward approach to the synthesis of highly substituted pyrrolidine derivatives (Gothelf & Jørgensen, 1998). Pyrrolidine ring is present in many biologically active natural compounds and pharmaceuticals (Gu *et al.*, 2004), and find utility in the treatment of diseases such as diabetes (Horri *et al.*, 1986), cancer (Tsukamoto *et al.*, 1989) and viral infections (Karpas *et al.*, 1988). Heterocycles with piperidine sub-structures display important biological activities, such as cytotoxic (El-Subbagh *et al.*, 2000) and anticancer (Dimmock *et al.*, 2001) besides being useful as synthons in the construction of alkaloid natural products (Lee *et al.*, 2001).

The bond lengths (Allen *et al.*, 1987) and angles in the title compound (Fig. 1) are within normal ranges. For the two pyrrolidine rings, N1/C11–C14 is twisted about the N1–C12 with the puckering parameters (Cremer & Pople, 1975)  $Q = 0.4589$  (16) Å and  $\varphi = 202.6$  (2) $^\circ$  whereas the N2/C11/C13/C22/C23 ring adopts an envelope conformation with atom N2 deviating by 0.251 (1) Å from the mean plane through the remaining atoms (puckering parameters  $Q = 0.3814$  (18) Å and  $\varphi = 356.2$  (3) $^\circ$ ). The cyclopentane (C13–C15/C20/C21) ring adopts an envelope conformation with the flap at atom C13 (puckering parameters  $Q = 0.2688$  (10) Å and  $\varphi = 186.5$  (10) $^\circ$ ). The two pyrrolidine rings make a dihedral angle of 41.72 (10) $^\circ$  between their least-squares planes. The molecular structure is stabilized by intramolecular O2—H12O…N2 hydrogen bond which generates an *S*(5) ring motif (Bernstein *et al.*, 1995).

Centrosymmetrically related molecules are linked *via* two pairs of intermolecular C26—H26A…O1 and C29—H29A…O2 interactions, forming  $R_{2}^2$  (16) ring motifs (Table 1). In the crystal packing (Fig. 2), the molecules are linked into two-dimensional networks parallel to the *ab* plane *via* C17—H17A…O1 interactions.

### Experimental

A mixture of 3,5-bis[*(E*)-benzylidene]tetrahydro-4(1*H*)-pyridinone (0.100 g, 0.364 mmol), ninhydrin (0.065 g, 0.364 mmol) and sarcosine (0.032 g, 0.364 mmol) were dissolved in methanol (10 ml) and refluxed for 1 h. After completion of the reaction as evident from TLC, the mixture was poured into water (50 ml). The precipitated solid was filtered and washed with water to obtain the product which was recrystallised from ethyl acetate to give the title compound as yellow crystals.

### Refinement

All H atoms were located in a difference Fourier map and refined freely. The highest residual electron density peak is located at 1.10 Å from H22A and the deepest hole is located at 0.65 Å from C22.

## *Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.130$	All H-atom parameters refined
$S = 1.06$	$w = 1/[\sigma^2(F_o^2) + (0.0728P)^2 + 0.7251P]$ where $P = (F_o^2 + 2F_c^2)/3$
4213 reflections	$(\Delta/\sigma)_{\max} = 0.001$
420 parameters	$\Delta\rho_{\max} = 0.58 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.29 \text{ e } \text{\AA}^{-3}$

## *Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
