Key indicators: single-crystal X-ray study; $T = 290\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.054; wR factor = 0.134; data-to-parameter ratio = 13.4.

In the title compound, $\text{C}_{11}\text{H}_{10}\text{ClNO}_2\cdot\text{H}_2\text{O}$, the organic molecule is roughly planar (r.m.s. deviation = 0.074 \AA). In the crystal structure, molecules are linked by $\text{O}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{N}$ hydrogen bonds and weak $\text{C}-\text{H}\cdots\pi$ and $\pi-\pi$ interactions [centroid–centroid distance = $3.578(3)\text{ \AA}$] consolidate the packing. A short $\text{Cl}\cdots\text{O}$ contact [$3.147(3)\text{ \AA}$] is also observed.

Comment

The importance and general background of the title compound is given in our earlier paper (Roopan *et al.*, 2009).

In the main molecule of the title compound (I), (Fig. 1), all the non-H atoms are roughly coplanar (r.m.s. deviation = 0.074 Å). The bond lengths and angles are comparable to the similar structures 2-chloro-3-hydroxymethyl-7,8-dimethylquinoline and 2-chloro-3-hydroxymethyl-6-methoxyquinoline (Khan *et al.*, 2010a,b), and also those in literature (Allen *et al.*, 1987).

The crystal structure is stabilized by intermolecular O—H···O and O—H···N interactions between the symmetry-related molecules (Table 1, Fig. 2). Adjacent molecules are stacked along the *b* axis through weak C—H···π interactions (Table 1) and π···π interactions [$Cg1\cdots Cg2(-x, 1 - y, -z) = 3.578(3)$ Å, where $Cg1$ and $Cg2$ are centroids of the N1/C1–C3/C8/C9 and C4–C9 rings, respectively]. In addition a short Cl1..O2 contact of 3.15 Å is also observed.

Experimental

2-Chloro-8-methoxyquinoline-3-carbaldehyde (222 mg, 1 mmol), sodium borohydride (38 mg, 1 mmol) and catalytic amount of montmorillonite K-10 were taken in an open vessel and the resulting mixture was irradiated at 500 W for 5 min. Ethylacetate was poured into the reaction mixture and filtered off. The filtrated after removal of solvent was subjected to column chromatography packed with silica and ethyl acetate/petroleum ether was used as the eluant. Colourless slabs of (I) were grown by solvent evaporation from a solution of the compound in chloroform.

Refinement

The H atoms of the water molecule were located in difference map and its positional parameters were refined freely [O3—H1W = 0.85 (5) and O3—H2W = 0.83 (4) Å]. The remaining H atoms were positioned geometrically, with O—H = 0.82 Å (for OH) and C—H = 0.93, 0.97 and 0.96 Å for aromatic, methylene and methyl H, respectively, and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5 U_{\text{eq}}(\text{O}, \text{C})$.

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating - R -factor-obs etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Symmetry codes: (i) $x-1/2, -y+1/2, z-1/2$.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg1 is the centroid of the N1/C1—C3/C8/C9 ring.
