Received 18 May 2010; accepted 1 June 2010

Key indicators: single-crystal X-ray study;  $T = 300$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.057;  $wR$  factor = 0.142; data-to-parameter ratio = 10.6.

The title compound,  $\text{C}_{20}\text{H}_{19}\text{N}_3\text{O}$ , was obtained by condensation of 2,3-dihydro-1H,9H-pyrrolo[2,1-b]quinazolin-9-one (alkaloid deoxyvasicinone, isolated from *Peganum Harmala*) with 4-(dimethylamino)benzaldehyde in the presence of sodium methoxide. The 2,3-dihydro-1H,9H-pyrrolo[2,1-b]-quinazolin-9-one part of the molecule is roughly planar (r.m.s. deviation = 0.0178 Å) and is essentially coplanar with the benzilidene ring (r.m.s. deviation = 0.0080 Å), forming a dihedral angle of 5.0 (1)°. The crystal structure is stabilized by two aromatic  $\pi$ - $\pi$  stacking interactions observed between the benzene rings of neighboring molecules [centroid-centroid distance = 3.7555 (19) Å].

**(*E*)-3-[4-(Dimethylamino)benzylidene]-2,3-dihydro-1*H*,9*H*-pyrrolo[2,1-*b*]quinazolin-9-one**

**B. Z. Elmuradov, R. Y. Okmanov, A. S. Abdurazakov, B. Tashkhodjaev and K. M. Shakhidoyatov**

**Comment**

The derivatives of tricyclic quinazoline alkaloids possess different pharmacological activities (Chatterjee & Ganguly, 1968; Al-Shamma *et al.*, 1981; Johne, 1981; Telezhenetskaya & Yunusov, 1977; Yunusov *et al.*, 1978) and was found simple and convenient methods of a synthesis of these compounds (Shakhidoyatov *et al.*, 1977; Shakhidoyatov & Kaysarov, 1998; Jahng *et al.*, 2008).

Condensation of 2,3-dihydro-1*H*-pyrrolo[2,1-*b*]quinazolin-9-one (alkaloid Deoxyvasicinone, isolated from *Peganum Harmala*) (Chatterjee & Ganguly, 1968) with 4-dimethylaminobenzaldehyde at 278 (1) K in presence of sodium methoxide (Elmuradov *et al.*, 2009) leads to the formation of (*E*)-3-(4-dimethylamino)benzylidene-2,3-dihydro-1*H*-pyrrolo[2,1-*b*]quinazolin-9-one (Figure 1).

The quinazoline part of molecule (C1/C2/C3/C3a/N4/C4a/C5/C6/C7/C8/C8a/C9/N10) is flat, r.m.s. deviation = 0.0178 Å, and benzilidene ring (C1'/C2'/C3'/C4'/C5'/C6'/C7') is also flat, r.m.s. deviation = 0.0080 Å, the angle between fragment planes is 5.0 (1)° (Figure 2). Torsion angle in fragment C3a–C3–C7'–C6' is 175.0 (5)° (Barnes *et al.*, 1985; Wu *et al.*, 1997), indicating the conjugation of  $\pi$ -electronic systems of pyrrolo(2,1-*b*)quinazolone and benzilidene rings. The sum of valent angles of all nitrogen atoms are close to 360° (Figure 3) which specifies  $sp^2$  hybridizations of nitrogen atoms. It specifies, that the lone electronic pair of nitrogen atoms participate in a conjugation with  $\pi$  electrons of aromatic ring. The crystal structure is stabilized by  $\pi$ - $\pi$  interactions between the benzene rings of neighbor standing molecules with the distance  $Cg3 \cdots Cg4^i = 3.7555$  (19) Å [symmetry code: (i) -x, 1 - y, 1 - z; Cg3 and Cg4 are centroid of the C1'-C6' and C4a/C5-C8/C8a two benzene rings].

**Experimental**

0.115 g sodium (5 mmole) was dissolved in 5 ml absolute methanol, and 0.186 g (1 mmole) of 2,3-dihydro-1*H*-pyrrolo[2,1-*b*]quinazolin-9-one and 0.151 g (1 mmole) 4-dimethylamino-benzaldehyde were added (Figure 1). Reaction mixture was left at 278 (1) K for 3 weeks. The dropped out single crystals, suitable for X-ray analysis were filtered, flushed at first with alcohol, then water. 0.05 g (16%) of the title compound was obtained in the reaction, m.p. 514-516 K.

**Refinement**

The 10% decay correction was applied by using the program *X-RED*. The H atoms bonded to C atoms were placed geometrically (with C–H distances of 0.98 Å for CH; 0.97 Å for CH<sub>2</sub>; 0.96 Å for CH<sub>3</sub>; and 0.93 Å for C<sub>ar</sub>) and included in the refinement in a riding motion approximation with  $U_{iso}(H)=1.2U_{eq}(C)$  [ $U_{iso}(H)=1.5U_{eq}(C)$  for methyl H atoms].

## (E)-3-[4-(Dimethylamino)benzylidene]-2,3-dihydro-1H,9H-pyrrolo[2,1-b]quinazolin-9-one

### Crystal data

$C_{20}H_{19}N_3O$

$M_r = 317.38$

Monoclinic,  $P2_1/c$

Hall symbol: -P 2ybc

$a = 8.8030$  (18) Å

$b = 16.415$  (3) Å

$c = 11.463$  (2) Å

$\beta = 105.05$  (3)°

$V = 1599.6$  (6) Å<sup>3</sup>

$Z = 4$

$F(000) = 672$

$D_x = 1.318$  Mg m<sup>-3</sup>

Melting point: 514(2) K

Cu  $K\alpha$  radiation,  $\lambda = 1.54184$  Å

Cell parameters from 12 reflections

$\theta = 10\text{--}20^\circ$

$\mu = 0.66$  mm<sup>-1</sup>

$T = 300$  K

Prismatic, light yellow

$0.60 \times 0.20 \times 0.15$  mm

### Data collection

Stoe Stadi-4 four-circle diffractometer

Radiation source: fine-focus sealed tube graphite

Scan width ( $\omega$ ) = 1.32 – 1.56, scan ratio  $2\theta:\omega = 0.00$   
I(Net) and sigma(I) calculated according to Blessing (1987)

Absorption correction:  $\psi$  scan (X-RED; Stoe & Cie, 1997).

$T_{\min} = 0.854$ ,  $T_{\max} = 0.906$

2446 measured reflections

2342 independent reflections

1728 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.000$

$\theta_{\max} = 60.0^\circ$ ,  $\theta_{\min} = 4.8^\circ$

$h = -9 \rightarrow 9$

$k = 0 \rightarrow 18$

$l = 0 \rightarrow 12$

3 standard reflections every 60 min

intensity decay: 10.0%

Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.057$	H-atom parameters constrained
$wR(F^2) = 0.142$	$w = 1/[\sigma^2(F_o^2) + (0.0446P)^2 + 1.0639P]$
$S = 1.13$	where $P = (F_o^2 + 2F_c^2)/3$
2342 reflections	$(\Delta/\sigma)_{\max} < 0.001$
220 parameters	$\Delta\rho_{\max} = 0.16 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.18 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001 \times Fc^2 \lambda^3 / \sin(2\theta)]^{-1/4}$
	Extinction coefficient: 0.0033 (3)

Special details

**Experimental.** Empirical absorption correction using  $\psi$  Scan. Reflections used  $\mu \cdot R = 0.00$

H K L,  $\theta$ ,  $\chi$ , I~min~/I~max~: -2 1 1 21.1 80.5 0.900

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
