Received 9 June 2010; accepted 10 June 2010

Key indicators: single-crystal X-ray study;  $T = 110\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.039;  $wR$  factor = 0.112; data-to-parameter ratio = 15.6.

In the chalcone title compound,  $\text{C}_{18}\text{H}_{17}\text{BrO}_4$ , the dihedral angle between the mean planes of the 2-bromo- and 3,4,5-trimethoxy-substituted benzene rings is  $89.3(1)^\circ$ . The angles between the mean plane of the prop-2-en-1-one group and the 2-bromophenyl and 3,4,5-trimethoxyphenyl ring planes are  $59.7(1)$  and  $40.5(8)^\circ$ , respectively. While no classical hydrogen bonds are present, three weak intermolecular  $\text{C}-\text{H}\cdots\text{O}$  interactions and weak  $\text{C}-\text{H}\cdots\text{Br}$  and  $\text{C}-\text{H}\cdots\text{Cg}$   $\pi$ -ring stacking interactions [ $\text{C}-\text{H}\cdots\text{Cg}$  distance =  $3.377(2)\text{ \AA}$ ] are observed, which contribute to the stability of crystal packing.

#### Comment

Chalcones, or 1,3-diaryl-2-propen-1-ones, belong to the flavonoid family. Chemically they consist of open-chain flavonoids in which the two aromatic rings are joined by a three-carbon  $\alpha,\beta$ -unsaturated carbonyl system. A vast number of naturally occurring chalcones are polyhydroxylated in the aryl rings. The radical quenching properties of the phenol groups present in many chalcones have raised interest in using the compounds or chalcone rich plant extracts as drugs or food preservatives (Dhar, 1981). Chalcones have been reported to possess many useful biological properties, including anti-inflammatory, antimicrobial, antifungal, antioxidant, cytotoxic, anticancer activities (Dimmock *et al.*, 1999). The crystal structures of some closely related chalcones, *viz.*, (E)-1-(4-bromophenyl)-3-(3,4,5-trimethoxy-phenyl)prop-2-en-1-one (Suwunwong *et al.*, 2009), (E)-1-(4-bromophenyl)-3-(2,4,6-trimethoxyphenyl)prop-2-en-1-one (Chantrapromma *et al.*, 2009) and 1-(4-bromophenyl)-3-(2,4,5-trimethoxyphenyl)prop-2-en-1-one (Patil *et al.*, 2006) have been reported. Hence in continuation with the synthesis and crystal structure determination and also owing to the importance of these flavanoid analogs, this new bromo-trimethoxy substituted chalcone, (I),  $C_{18}H_{17}BrO_4$ , is synthesized and its crystal structure is reported.

The title compound, (I),  $C_{18}H_{17}BrO_4$ , is a chalcone with 2-bromophenyl and 3,4,5-trimethoxyphenyl rings bonded at opposite sides of a propene group (Fig. 2). The dihedral angle between mean planes of the benzene rings in the *ortho*-bromo and *meta*-*para*-trimethoxy substituted rings is  $89.3(1)^\circ$ . The angles between the mean plane of the prop-2-ene-1-one group (C1/C7/O1/C8) and the mean planes of the benzene rings in the 2-bromophenyl (C1–C6) and 3,4,5-trimethoxyphenyl rings (C10–C15) are  $59.7(1)^\circ$  and  $40.5(8)^\circ$ , respectively. Bond distances and angles are in normal ranges (Allen, 2002). While no classical hydrogen bonds are present, three weak intermolecular C—H···O interactions (Fig. 3) and weak C—H···Br (Table 1) and C17—H17A···Cg2  $\pi$ -ring stacking interactions ( $H17A\cdots Cg2 = 2.83 \text{ \AA}$ ;  $H17A\cdots \text{Perp} = 2.82 \text{ \AA}$ ;  $C17\cdots H17A\cdots Cg2 = 125^\circ$ ;  $C17\cdots Cg2 = 3.379(2) \text{ \AA}$ ;  $Cg2 = C10\cdots C15$ ) are observed which contribute to the stability of crystal packing.

#### Experimental

A 50% KOH solution was added to a mixture of 2-bromo acetophenone (0.01 mol, 1.99 g) and 3,4,5-trimethoxy benzaldehyde (0.01 mol, 1.96 g) in 25 ml of ethanol (Fig. 1). The mixture was stirred for an hour at room temperature and the precipitate was collected by filtration and purified by recrystallization from ethanol. The single-crystal was grown from ethyl acetate by slow evaporation method and yield of the compound was 45% (m.p. 325–327 K). Analytical data: Found (Calculated) for  $C_{18}H_{17}BrO_4$ : C %: 57.26 (57.31%); H %: 4.49 (4.54%).

#### Refinement

The H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms with C—H distances = 0.95–0.96 Å and with  $U_{\text{iso}}(\text{H}) = 1.18\text{--}1.50 U_{\text{eq}}(\text{C})$ .

<i>Z</i> = 8	0.47 × 0.42 × 0.31 mm

### Data collection

Oxford Diffraction Xcalibur diffractometer with a Ruby (Gemini Cu) detector	3296 independent reflections
Radiation source: Enhance (Cu) X-ray Source	2940 reflections with $I > 2\sigma(I)$

graphite	$R_{\text{int}} = 0.022$
Detector resolution: 10.5081 pixels mm <sup>-1</sup>	$\theta_{\text{max}} = 26.3^\circ, \theta_{\text{min}} = 2.6^\circ$
$\omega$ scans	$h = -12 \rightarrow 7$
Absorption correction: multi-scan ( <i>CrysAlis RED</i> ; Oxford Diffraction, 2007)	$k = -16 \rightarrow 15$
$T_{\text{min}} = 0.499, T_{\text{max}} = 1.000$	$l = -30 \rightarrow 28$
8122 measured reflections	

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.112$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0769P)^2 + 1.9413P]$ where $P = (F_o^2 + 2F_c^2)/3$
3296 reflections	$(\Delta/\sigma)_{\text{max}} = 0.003$
211 parameters	$\Delta\rho_{\text{max}} = 0.46 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.67 \text{ e \AA}^{-3}$

### Special details

**Experimental.** IR data (KBr)  $\nu \text{ cm}^{-1}$ : 2998 cm<sup>-1</sup>, 2937 cm<sup>-1</sup>, 2839 cm<sup>-1</sup> (C—H al. str), 3058 cm<sup>-1</sup> (C—H ar.str) 1646 cm<sup>-1</sup> (C=O), 1580 cm<sup>-1</sup> (C=C); 1245 cm<sup>-1</sup> (C—O—C).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

Cg2 is the centroid of the C10—C15 ring.

$D\cdots H\cdots A$	$D\cdots H$	$H\cdots A$	$D\cdots A$	$D\cdots H\cdots A$
C6—H6A $\cdots$ O1 <sup>i</sup>	0.95	2.44	3.233 (3)	140
