Received 26 June 2010; accepted 30 June 2010

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$; R factor = 0.069; wR factor = 0.209; data-to-parameter ratio = 15.6.

The asymmetric unit of the title compound, $[\text{Ni}(\text{C}_{18}\text{H}_{24}\text{N}_2\text{O})_2](\text{NO}_3)_2$, consists of one half of the centrosymmetric nickel(II) complex cation and a nitrate anion. The Ni^{II} atom, lying on an inversion center, is four-coordinated by the phenolate O atoms and imine N atoms of two Schiff base ligands, forming a square-planar geometry. The O- and N-donor atoms are mutually *trans*. In the crystal structure, the nitrate anions are linked to the complex cations by intermolecular N—H \cdots O hydrogen bonds.

Bis{1-[3-(diethylammonio)propyliminomethyl]naphthalen-2-olato}nickel(II) dinitrate

X.-H. Ji and J.-F. Lu

Comment

Schiff bases are known to be versatile ligands in coordination chemistry (Hamaker *et al.*, 2010; Wang *et al.*, 2010; Mirkhani *et al.*, 2010; Liu & Yang, 2009). A large number of complexes with Schiff bases have been reported because of their interesting structures and potential applications (Keypour *et al.*, 2009; Adhikary *et al.*, 2009; Peng *et al.*, 2009). We report here the crystal structure of the title new nickel complex with the Schiff base ligand 1-[(3-diethylaminopropylimino)methyl]naphthalen-2-ol.

The compound consists of a centrosymmetric mononuclear nickel complex cation and two nitrate anions (Fig. 1). The Ni atom, lying on the inversion center, is four-coordinated by two phenolate O atoms and two imine N atoms from two Schiff base ligands, forming a square planar geometry. The bond lengths (Table 1) around the Ni atom are comparable to those observed in similar nickel complexes (Bhatia *et al.*, 1983; Kamenar *et al.*, 1990; Connor *et al.*, 2003; Lacroix *et al.*, 2004).

In the crystal structure, the nitrate anions are linked to the complex cations by intermolecular N2—H2···O2 and N2—H2···O3 hydrogen bonds.

Experimental

2-Hydroxy-1-naphthaldehyde (0.1 mmol, 17.2 mg) and *N,N*-diethylpropane-1,3-diamine (0.1 mmol, 13.0 mg) were mixed and stirred in methanol (10 ml) for 30 min. Then a methanol solution (5 ml) of nickel nitrate (0.1 mmol, 29.1 mg) was added to the mixture. The final mixture was stirred for another 30 min to give a red solution. Single crystals suitable for X-ray diffraction were obtained by slow evaporation of the solution at room temperature.

Refinement

H2 atom was located from a difference Fourier map and refined isotropically, with the N—H distance restrained to 0.90 (1) Å, and with $U_{\text{iso}}(\text{H})$ fixed at 0.08 Å². The remaining H atoms were positioned geometrically (C—H = 0.93–0.97 Å) and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ and $1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$. Rotating group models were used for the methyl groups.

Figures

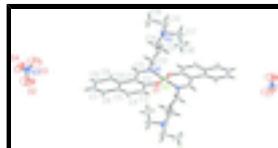

Fig. 1. The molecular structure of the title complex, showing 30% probability displacement ellipsoids and the atom-numbering scheme. Unlabeled atoms are related to labeled atoms by the symmetry operation $2 - x, -y, -z$.

Data collection

Bruker APEXII CCD area-detector diffractometer	3689 independent reflections
Radiation source: fine-focus sealed tube graphite	2616 reflections with $I > 2\sigma(I)$
ω scans	$R_{\text{int}} = 0.055$
Absorption correction: multi-scan (<i>SADABS</i> ; Sheldrick, 2004)	$\theta_{\text{max}} = 27.0^\circ, \theta_{\text{min}} = 1.9^\circ$
$T_{\text{min}} = 0.875, T_{\text{max}} = 0.885$	$h = -14 \rightarrow 14$
14203 measured reflections	$k = -16 \rightarrow 16$
	$l = -15 \rightarrow 15$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.069$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.209$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.1045P)^2 + 2.3396P]$ where $P = (F_o^2 + 2F_c^2)/3$
3689 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
237 parameters	$\Delta\rho_{\text{max}} = 1.12 \text{ e \AA}^{-3}$

10 restraints

 $\Delta\rho_{\min} = -0.56 \text{ e } \text{\AA}^{-3}$ *Special details*

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
