Received 2 July 2010; accepted 9 July 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; disorder in main residue; R factor = 0.045; wR factor = 0.125; data-to-parameter ratio = 23.1.

The Sn^{IV} atom in the title compound, $[\text{Sn}(\text{C}_4\text{H}_9)_2(\text{C}_9\text{H}_{16}\text{NS}_2)_2]$, is chelated by the two dithiocarbamate ions in a six-coordinate skew-trapezoidal-bipyramidal geometry. The two butyl groups are disordered over two positions in a 1:1 ratio.

Related literature

Di-n-butylbis(*N*-cyclohexyl-*N*-ethylidithiocarbamato- κ^2S,S')tin(IV)

N. Awang, I. Baba, B. M. Yamin and S. W. Ng

Comment

Diorganotin(IV) bis(chelates) generally adopt six-coordinate geometries at tin, a geometry for which the carbon–tin–carbon bond angle is about 135° (Ng *et al.*, 1987). The dithiocarbamate ion is an example of a chelating ligand that imposes such a geometry on the tin atom in diorganotin(IV) compounds. The angle at tin is generally unaffected by the size of the organic group bonded to the metal atom or the steric size of the dithiocarbamate ion. In the title compound (I) (Scheme I, Fig. 1), this angle is 145.4 (2)° and the angle formed by the formally neutral sulfur atom is opened up to 144.13 (3)°.

Experimental

Cabon disulfide (30 mmol) was dropped into an ethanol solution (100 ml) of *N*-cyclohexyl-*N*-ethylamine (30 mmol). The solution was kept at 273 K for an hour. Dibutyltin dichloride (15 mmol) dissolved in ethanol (100 ml) was added to give a white precipitate. This was collected and recrystallized from a chloroform/ethanol (1/1) mixture.

Refinement

The carbon atoms of the butyl chains (except for the carbon atoms connected to the tin atom) show large thermal ellipsoids. The disorder could not be refined, and was assumed to be a 1:1 disorder. The 1,2-related carbon–carbon distances were restrained to 1.54 ± 0.01 Å and the 1,3-related ones to 2.51 ± 0.01 Å. The temperature factors of the primed atoms were set to those of the unprimed ones; the anisotropic temperature factors of the disordered atoms were restrained to be nearly isotropic. Carbon-bound H-atoms were placed in calculated positions ($C—H = 0.93$ to 0.97 Å) and were included in the refinement in the riding model approximation, with $U_{iso}(H)$ set to 1.2 to $1.5U_{eq}(C)$. The final difference Fourier map had a peak in the vicinity of Sn1.

Figures

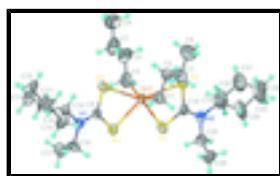

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of (I) at the 50% probability level. The disorder in the butyl chains is not shown.
