Received 1 July 2010; accepted 16 July 2010

Key indicators: single-crystal X-ray study; $T = 170\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.034; wR factor = 0.071; data-to-parameter ratio = 14.9.

In the title compound, $[\text{Zn}(\text{C}_7\text{H}_5\text{O}_2)_2(\text{C}_{10}\text{H}_{10}\text{N}_2)_2]$, the Zn^{II} ion, located on a twofold axis, is coordinated by two N atoms from two 3-(pyrrol-1-ylmethyl)pyridine ligands and two O atoms from two benzoate ligands in a distorted tetrahedral geometry. The pyridine and the pyrrole rings are nearly perpendicular to each other, making a dihedral angle of $84.83(7)^{\circ}$.

Dibenzoatobis[3-(pyrrol-1-ylmethyl)pyridine]zinc(II)

H. G. Lee, J. H. Kim, P.-G. Kim, C. Kim and Y. Kim

Comment

The interaction of transition metal ions with biologically active molecules such as amino acids, proteins, sugars, nucleotides *etc*, is of great importance in the study of biological systems (Daniele, *et al.*, 2008; Parkin, 2004; Tshuva & Lippard, 2004). As possible models for studying such interaction, the chemistry of transition metal ions with fulvic acids and humic acids has been intensively examined. Our group have reported a variety of structures of copper(II) and zinc(II) benzoates with quinoxaline, 6-methylquinoline, 3-methylquinoline, *trans*-1-(2-pyridyl)-2-(4-pyridyl)ethylene, and di-2-pyridyl ketone (Lee, *et al.*, 2008; Yu, *et al.*, 2008; Park, *et al.*, 2008; Shin, *et al.*, 2009; Yu, *et al.*, 2009; Yu *et al.*, 2010) in order to study the interaction of the transition metal ions with various acids. In this work, we have employed zinc(II) benzoate as a building block and 3-(pyrrol-1-ylmethyl)pyridine as a ligand.

In the title compound, the Zn^{II} ion is located on a two fold axis and is coordinated by two nitrogen atoms from two symmetry related 3-(pyrrol-1-ylmethyl)pyridine ligands and two oxygen atoms from two symmetry related benzoate ligands to form a distorted tetrahedral geometry (Fig. 1). Zn—N and Zn—O bond distances are in agreement with reported bond distances in the Cambridge Structural Database (Allen, 2002). The pyridine and the pyrrol rings are nearly perpendicular to each other making a dihedral angle of 84.83 (7)^o.

Experimental

30.4 mg (0.1 mmol) of Zn(NO₃)₂·6H₂O and 28.0 mg (0.2 mmol) of C₆H₅COONH₄ were dissolved in 4 ml H₂O and carefully layered by 4 ml acetone solution of 3-(pyrrol-1-ylmethyl)pyridine (31.8 mg, 0.2 mmol). Suitable crystals of the title compound for X-ray analysis were obtained in a few weeks.

Refinement

H atoms were placed in calculated positions and treated as riding with C—H distances of 0.95 Å (pyridine and pyrrolidine) and 0.99 Å (methylene) and with U_{iso}(H)= 1.2U_{eq}(C).

Figures

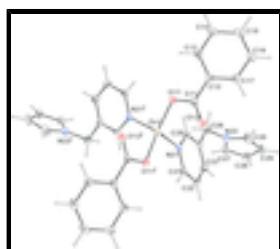

Fig. 1. The structure of the title compound showing the atom-labeling scheme. Displacement ellipsoids are shown at the 30% probability level. H atoms are represented as small spheres of arbitrary radii. [Symmetry code: (i) 1-x, y, 3/2-z].

2904 independent reflections	$l = -13 \rightarrow 13$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.034$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.071$	H-atom parameters constrained
$S = 0.91$	$w = 1/[\sigma^2(F_o^2) + (0.0248P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
2904 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
195 parameters	$\Delta\rho_{\text{max}} = 0.52 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.51 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
