## 2-Hydroxy-3-nitrobenzaldehyde

## Bei Tang, Guangying Chen,* Xiaoping Song,* Changchun Cen and Changri Han

Key Laboratory of Tropical Medicinal Plant Chemistry of the Ministry of Education, Hainan Normal University, College of Chemistry \& Chemical Engineering, Hainan Normal University, Haikou 571158, People's Republic of China
Correspondence e-mail: chgying123@163.com, sxp628@126.com
Received 11 June 2010; accepted 26 June 2010

Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.038 ; w R$ factor $=0.119$; data-to-parameter ratio $=11.3$.

The title compound, $\mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{4}$, isolated from the leaves of Actephila merrilliana, is essentially planar (r.m.s. deviation $=$ $0.026 \AA$ ). The conformation is supported by an intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond, which generates an $S(6)$ ring. In the crystal, $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions and aromatic $\pi-\pi$ stacking [centroid-centroid distance $=3.754(4) \AA$ A help to establish the packing.

## Comment

Although chemical investigations into specimens of the plant family Euphorbiaceae are very common, there have been no related reports on chemical constituents of Actephila merrilliana (Ovenden et al., 2001). The plants in this family were used in folk medicine such as, for the treatment of hemorrhoids and as anti-inflammatory agents (Song et al., 2007). The title compound was isolated from the $75 \% \mathrm{EtOH}$ extract of the leaves of Actephila merrilliana which were collected from Sanya City, Hainan Province, P. R. China. We have undertaken the X-ray crystal structure analysis of the title compound in order to establish its molecular structure and relative stereochemistry. In the title compound, the bond lengths and angles in (I) have normal values, and are comparable with those in the related structures (Rizal et al., 2008; Garden et al., 2004). An intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond helps to establish an essentially planar conformation for the molecule (r.m.s. deviation $=0.0258 \AA$ ).

In the crystal, molecules are linked by intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds into chains (Fig.2). The hydrogen bonds and angles are listed in Table 1.

## Experimental

Air-dried leaves of Actephila merrilliana ( 14.0 kg ) were ground and percolated ( $3 \times 3 \mathrm{~h}$ ) with $75 \% \mathrm{EtOH}$ at $60^{\circ} \mathrm{C}$, which was suspended in 6 L water and then partitioned with petroleum ether, chloroform, ethyl acetate and n-BuOH, successively, yielding a petroleum ether extract, a chloroform extract, an ethyl acetate extract and a n- BuOH extract, respectively. The chloroform extract was subjected to a silica gel CC column using petroleum ether as first eluent and then increasing the polarity with EtOAc, to afford 23 fractions (A-W). Fraction M was further separated by column chromatography with a gradient of petroleum ether-EtOAc to give the title compound. The crude product was dissolved in a small amount of chloroform to obtain colourless blocks of (I) by slow evaporation of a chloroform solution at 298 K .

## Refinement

H atoms bonded to C atoms were palced in geometrically calculated position and were refined using a riding model, with $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C}) . \mathrm{H}$ atoms attached to O atoms were found in a difference Fourier synthesis and were refined using a riding model, with the $\mathrm{O}-\mathrm{H}$ distances fixed as initially found and with $U_{\text {iso }}(\mathrm{H})$ values set at $1.5 \mathrm{Ueq}(\mathrm{O})$.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$ factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
