# 2,5-Dihydroxyterephthalic acid dihydrate 

## Po-Wen Cheng, Chi-Feng Cheng, Yeh Chun-Ting and Chia-Her Lin*

Department of Chemistry, Chung-Yuan Christian University, Chung-Li 320, Taiwan Correspondence e-mail: chiaher@cycu.edu.tw

Received 25 June 2010; accepted 30 June 2010
Key indicators: single-crystal X-ray study; $T=295 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.061 ; w R$ factor $=0.193$; data-to-parameter ratio $=16.5$.

The title compound, $\mathrm{C}_{8} \mathrm{H}_{6} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, was obtained by accident within a project on the synthesis of metal-organic coordination polymers by the reaction of LiOH with 2,5 -dihydroxyterephthalic acid under solvothermal conditions. The asymmetric unit consists of half a 2,5 -dihydroxyterephthalic acid molecule located on a centre of inversion and one solvent water molecule that occupies a general position. The 2,5dihydroxyterephthalic acid molecules are connected to the water molecules via $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonding to form a layer in the $a b$ plane.

## supplementary materials

## 2,5-Dihydroxyterephthalic acid dihydrate

P.-W. Cheng, C.-F. Cheng, Y. Chun-Ting and C.-H. Lin

## Experimental

The solvothermal reactions were carried out in Teflon-lined digestion bombs (internal volume of 23 ml ) under autogenously pressure by heating the reaction mixtures followed by slow cooling at $6 \mathrm{~K} \mathrm{~h}^{-1}$ to room temperature. Crystals of the title compound were obtained from the reaction of 2,5-dihydroxyterephthalic acid $\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{6}, 0.198 \mathrm{~g}, 1.0 \mathrm{mmol}\right)$ with $\mathrm{Li}(\mathrm{OH})$ $(0.048 \mathrm{~g}, 2.0 \mathrm{mmol})$ in $\mathrm{H}_{2} \mathrm{O}(10.0 \mathrm{ml})$. The mixture was heated at 363 K for 3 d . On cooling light-yellow crystals had formed.

## Refinement

The H atoms of the benzene rings were placed in idealized positions and constrained to ride on their parent atoms, with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. The hydroxyl H atoms of the carboxyl groups were placed in ideal positions with the $\mathrm{O}-\mathrm{H}$ bond trans to the longest bond of the adjacent atom $(\mathrm{O}-\mathrm{H}=0.82 \AA)$ and refined using a riding model. One H atom of the water molecule were located in difference map, the other placed in an ideal position in order that reasonable hydrogen bonding is found. Finally they were refined using a riding model with $\mathrm{O}-\mathrm{H}=0.85 \AA$. All $\mathrm{O}-\mathrm{H}$ H atoms were refined with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{O})$.

73 parameters
0 restraints

Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map Hydrogen site location: inferred from neighbouring sites
H -atom parameters constrained
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0851 P)^{2}\right]$
where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\max }=0.009$
$\Delta \rho_{\max }=0.36 \mathrm{e} \AA^{-3}$
$\Delta \rho_{\min }=-0.32$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations
between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.

Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$ factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
