## Cyanomethanaminium tetrafluoroborate

Meng Ting Han and Yuan Zhang\*

Ordered Matter Science Research Center, College of Chemistry and Chemical Engineering, Southeast University, Nanjing 211189, People's Republic of China  
Correspondence e-mail: zhangshelley86@hotmail.com

Received 19 June 2010; accepted 1 July 2010

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.034;  $wR$  factor = 0.097; data-to-parameter ratio = 10.2.

In the title compound,  $\text{C}_2\text{H}_5\text{N}_2^+\cdot\text{BF}_4^-$ , the cations and anions are connected *via* intermolecular  $\text{N}-\text{H}\cdots\text{F}$  and  $\text{C}-\text{H}\cdots\text{F}$  hydrogen bonds, forming a three-dimensional network.

## Cyanomethanaminium tetrafluoroborate

M. T. Han and Y. Zhang

### Comment

At present, much attention in ferroelectric material field is focused on developing ferroelectric pure organic or inorganic compounds (Haertling, 1999; Homes *et al.*, 2001). Recently we have reported the synthesis of a variety of compounds (Fu *et al.*, 2009; Hang *et al.*, 2009), which have potential piezoelectric and ferroelectric properties. In order to find more dielectric ferroelectric materials, we have investigate the physical properties of the title compound. The dielectric constant of the title compound as a function of temperature indicates that the permittivity is basically temperature-independent (dielectric constant equaling to 3.6 to 4.7), suggesting that this compound should not be ferroelectric or there may be no distinct phase transition within the measured temperature range. Similarly, below the melting point (453 K) of the compound, the dielectric constant as a function of temperature also goes smoothly, and there is no dielectric anomaly observed (dielectric constant equaling to 3.6 to 4.7). Herein, we report the synthesis and crystal structure of the title compound.

The molecular structure of the title compound is presented in Fig. 1. The bond lengths and angles are within their normal ranges (Wishkerman & Bernstein, 2006). The cations and anions are connected *via* intermolecular N—H...F and C—H...F hydrogen bonds, forming a three dimensional network (Tab. 1 & Fig. 2).

### Experimental

A mixture of aminoacetonitrile hydrochloride (0.095 g, 0.01 mol) and tetrafluoro-borate sodium (1.10 g, 0.01 mol) in water (20 ml) was stirred until clear. After several days, colourless prismatic crystals of the title compound were formed which were suitable for X-ray analysis.

### Refinement

The methylene H-atoms were positioned geometrically and refined using a riding model, with C—H = 0.97 Å and  $U_{\text{iso}}(\text{H}) = 1.2_{\text{eq}}(\text{C})$ . The H-atoms bonded to the N-atom were located from a difference map and were allowed to refine freely.

### Figures

Fig. 1. Perspective structure of the title compound, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

Fig. 2. The crystal packing of the title compound viewed along the *a* axis showing the hydrogen bondings network.

methods

Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring  
sitesH atoms treated by a mixture of independent and  
constrained refinement $w = 1/[\sigma^2(F_o^2) + (0.0711P)^2 + 0.9831P]$ where  $P = (F_o^2 + 2F_c^2)/3$  $(\Delta/\sigma)_{\max} < 0.001$  $\Delta\rho_{\max} = 0.21 \text{ e \AA}^{-3}$  $\Delta\rho_{\min} = -0.19 \text{ e \AA}^{-3}$ Extinction correction: *SHELXL97* (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$ 

Extinction coefficient: 0.034 (4)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
