## 6,14-Dibromo-2,11-dithia[3.3]paracyclophane

X. Zhu and M. Hu

### Comment

As a contribution to a structural study of dithia[3.3]paracyclophane derivatives with the bromine substituents (Huang *et al.*, 2010), herewith we present the crystal structure of the title compound (Fig. 1).

The short distance of 3.313 (5) Å between the centroids of two benzene rings is less than the normal packing distance (3.4 Å) between the aromatic rings in organic compounds, thus supporting potential transannular  $\pi$ - $\pi$  interaction between the rings in the cyclophane unit.

### Experimental

The dithiaparacyclophanes were prepared by coupling the corresponding pair of dithiol and dibromide under high dilution conditions (Wang *et al.*, 2003, 2006). A solution with equimolar amounts of the dithiol and the dibromide in degassed THF (500 ml) was added dropwise under N<sub>2</sub> over 12 h to a refluxing solution of K<sub>2</sub>CO<sub>3</sub> (5 equiv) in EtOH (1.2 L). After an additional 2 h at the reflux temperature, the mixture was cooled and the solvent were removed. The resulting residue was treated with CH<sub>2</sub>Cl<sub>2</sub>(300 ml) and water (300 ml). The organic phase was separated, the aqueous extracted with CH<sub>2</sub>Cl<sub>2</sub> three times. The combined organic layers were dried over Na<sub>2</sub>SO<sub>4</sub>, then solvent was removed, and the resulting solid was chromatographed on silica gel using CH<sub>2</sub>Cl<sub>2</sub> petroleum ether (1:1, *v/v*) as eluent.

### Refinement

All H atoms were initially located in a difference map, but were constrained to an idealized geometry. Constrained bond lengths and isotropic displacement parameters: (C—H = 0.93 Å) and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for aromatic H atoms, and (C—H = 0.97 Å) and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for methylene, and (C—H = 0.96 Å) and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl.

### *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
