Received 5 July 2010; accepted 27 July 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.049; wR factor = 0.139; data-to-parameter ratio = 8.3.

The title compound, $C_{18}H_{26}O_7$, is an eremophilenolide which has been isolated from the plant *Ligularia duciformis* for the first time. The present study confirms the atomic connectivity assigned on the basis of ^1H and ^{13}C NMR spectroscopy. The molecule contains three fused rings, two six-membered rings in chair conformations and a five-membered ring in a flattened envelope conformation. Two hydroxy groups are involved in formation of intra- and intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds. The latter ones link molecules into chains propagating in [010].

Related literature

For related compounds extracted from *Ligularia duciformis* and *Cacalia roborowski*, see Wang *et al.* (2008) and Zhang *et al.* (1998), respectively.

3 β -Acetoxy-8 β ,10 β -dihydroxy-6 β -methoxyeremophil-7(11)-en-8,12-olide

H.-B. Wu, H. Li, X.-C. Lan and W.-S. Wang

Comment

Ligularia duciformis(C. Winkl.) Hand.-Mazz. grows in the western area of mainland China. It is used in traditional Chinese medicine having effects on dispelling phlegm and relieving cough activities. As a part of our research on biological resource by ethnic minorities in China, the title compound was isolated. Its structure was identified by NMR spectra data and compared with the previous reports (Zhang *et al.*, 1998; Wang *et al.*, 2008). Herewith we present its crystal structure.

The molecule of the title compound contains a three-ring system A/B/C(Fig.1). There is a *cis* junction between the rings A(C9–C5/C10) and B (C5–C3/C12–C10), while the methoxy group at C4 site and the hydroxyl group at C12 site are in the same orientation with two methyl groups at C6 and C5 sites. Rings A and B are both in chair conformations. The furan ring C (C12–C3/C2–C1/O1), of course, is in envelope-like conformations. Two hydroxy groups are involved in formation of intra- and intermolecular O—H···O hydrogen bonds (Table 1). The latter ones link molecules into chains propagated in direction [010].

Experimental

The air-dried whole plant of *Ligularia duciformis* (1.5 kg) were pulverized and extracted three times with MeOH (each for 7 days) at room temperature. The extract was concentrated to give a residue (110 g), which was further separated by CC (SiO₂, 200–300mesh, petroleum ether/EtOAc (30:1, 20:1, 15:1, 10:1, 8:1, 5:1, 3:1, 2:1, 1:1, 1:1.5 (v/v)) to yield 10 fractions: Fr. 1–10. Each fraction was examined by TLC and combined to afford many subfractions. Fr.8a (1.4 g) was subjected to CC (SiO₂, 200–300mesh, petroleum ether/ EtOAc 8:1, 5:1 (v/v)) to provide the title compound (80 mg). ¹H and ¹³C NMR spectral data of this compounds was recorded on Bruker-AV-500 s pectrometer, using CDCl₃ as solvent and Me₄Si as internal standard. The stereochemistry can be observed by X-ray diffraction experiment.

Refinement

The hydrogen atoms were placed in calculated positions with C—H = 0.98–1.00 Å and O—H = 0.82 Å, and refined as riding with $U_{\text{iso}}(\text{H})$ = 1.2–1.5 Ueq(C,O). In the absence of any significant anomalous scatterers in the molecule, the absolute configuration has been arbitrarily assigned.

Figures

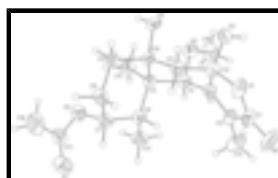

Fig. 1. View of the title molecule showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

	Extinction coefficient: 0.130 (8)

Special details

Experimental. Since the two skeleton methyl group in eremophilenolides are biogenic β position, we draw the relative stereochemistry of the title eremophilenolide, by reference to the structures of related eremophilenolides in Wang et al. (2008) and Zhang et al.

(1998) although the absolute configuration could not be reliably determined from anomalous dispersion effects. Furthermore, the relative stereochemistry in the title compound was confirmed by NMR data. ^{13}C NMR (125 MHz, CDCl_3 , δ , p.p.m.): 177.0(C17), 170.2(C1), 152.9(C3), 129.7(C2), 103.4(C12), 79.8(C4), 74.7(C10), 71.4(C7), 57.9(C16), 47.4(C5), 44.3(C11), 36.5(C6), 30.0(C8), 27.5(C9), 21.3(C18), 12.8(C14), 12.5(C15), 8.8(C13).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
