Received 8 July 2010; accepted 3 August 2010

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.038; wR factor = 0.097; data-to-parameter ratio = 25.7.

The title compound, $[\text{Cr}(\text{C}_{15}\text{H}_{14}\text{O})(\text{CO})_3]$, displays a distorted envelope configuration of the dihydropyran ring. The dihedral angle between the phenyl and phenylene rings is $50.63(4)^\circ$. The Cr^0 atom is coordinated by three CO groups and the phenylene ring of the flavan ligand in an η^6 mode, with a common arene-to-metal distance

Racemic tricarbonyl[(4a,5,6,7,8,8a-*H*)-2-phenyl-3,4-dihydro-2*H*-1-benzopyran]chromium(0)

J. H. van Tonder, B. C. B. Bezuidenhoudt and J. M. Janse van Rensburg

Comment

The title compound forms part of a series of chromium(0) complexes of the type $[\text{Cr}(\text{flav})(\text{CO})_3]$ (flav = flavan, flavone or isoflavone ligand) (van Tonder *et al.*, 2009a,b). Our interest in this type of chromium(0) complexes is partly due to their importance in organic synthesis, as noted earlier (Muschalek *et al.*, 2007).

As illustrated in Fig. 1, the $\text{Cr}(\text{CO})_3$ group coordinates to the phenylene ring of the flavanoid backbone (Table 1). The distance between the Cr^0 atom and the centroid of the A- η^6 -coordinated arene ring is 1.731 (1) Å (r.m.s of fitted atoms C5–C10 = 0.0186 Å). Molecular distortion is displayed by the twisted flavan backbone. Atoms C4 and O5 is essentially in the plane of the coordinated arene ring (r.m.s of atoms C4–C10 and O5 = 0.0202 Å), while atoms C2 and C3 are respectively displaced by -0.244 (2) and 0.478 (2) Å from the plane formed by atoms C4–C10 and O5. This distortion is a result of the expected envelope configuration in the dihydropyran ring. In turn the phenyl ring is twisted away from the plane of atoms C4–C10 and O5, with a dihedral angle of 50.88 (4)°. The crystal packing displays an intermolecular C—H···π soft contact [H···centroid distance = 2.92 Å] between the phenyl ring of one molecule and the arene ring of a neighbouring molecule (Fig. 2). The crystal packing is also stabilized by a C—H···O soft contact between atoms H8 and O5, with a distance of 2.57 Å and a C8—H8···O5 angle of 140°.

Experimental

Flavan was synthesized via H_2SO_4 catalyzed hydrogenation (5 bar) over 10% Pd/C from flavan-4-one [flavan-4-one (2.00 g, 8.9 mmol), 10 % Pd/C (0.10 g), 3 M H_2SO_4 (1 ml), EtOH (50 ml)]. Purification by means of flash column-chromatography yielded flavan (0.94 g, 49.9%) as a colourless oil. R_f 0.77 (H:A, 8:2).

Preparation of the title compound was based on a method described by Müller *et al.* (1999). A solution of flavan (0.51 g, 2.4 mmol) and $\text{Cr}(\text{CO})_6$ (0.53 g, 2.4 mmol) in $\text{Bu}_2\text{O}:\text{THF}$ (9:1, 10 ml per 100 mg) was degassed with argon, using standard Schlenk techniques, and refluxed (48 h) under an oxygen free atmosphere. The reaction mixture was cooled to room temperature and the solvent evaporated in vacuo. Purification through flash column-chromatography yielded tricarbonyl(A- η^6 flavan)chromium(0) (0.08 g, 9.2%) as a yellow solid. Recrystallization from diethyl ether yielded yellow cuboidal crystals. R_f 0.23 (hexane:acetone, 8:2); Mp 170.4°C.

Refinement

H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93 (aromatic), 0.98 (CH) and 0.97 (CH_2) Å and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.
