Received 17 July 2010; accepted 29 July 2010

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.044;  $wR$  factor = 0.135; data-to-parameter ratio = 13.6.

The asymmetric unit of the title compound,  $\text{C}_{13}\text{H}_{10}\text{FN}_3\text{OS}_2$ , contains two independent molecules, which differ slightly in the relative orientations of the triazole and ethylsulfanyl groups with respect to the planar thiochromen-4-one frameworks. The dihedral angles between the mean planes of the triazole groups and the corresponding six-membered  $\text{C}_5\text{OS}$  rings are  $56.8(1)$  and  $52.9(1)^\circ$ , while the  $\text{S}-\text{C}-\text{S}-\text{C}$  dihedral angles are  $-11.7(2)$  and  $-16.3(2)^\circ$ . In the crystal structure, intermolecular  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{N}$  hydrogen bonds link the molecules in a stacked arrangement along the  $a$  axis. A weak intramolecular  $\text{C}-\text{H}\cdots\text{O}$  interaction results in the formation of a non-planar five-membered ring.

## 2-Ethylsulfanyl-7-fluoro-3-(1H-1,2,4-triazol-1-yl)-4H-thiochromen-4-one

T. Xiao, Y. Li, D. Liu and G. Yu

### Comment

The title compound,  $C_{13}H_{10}ON_3S_2F$ , is a new molecule which has a potential use as antifungal. Its molecular structure of is shown in Fig. 1 and selected geometric parameters are given in Table 1. The bond lengths and angles are within normal ranges (Allen *et al.*, 1987). The asymmetric unit of the title compound contains two independent molecules. They differ slightly in the relative orientations of the triazole and ethylsulfanyl groups with respect to the planar thiochromen-4-one frameworks. The dihedral angles between the mean planes of the triazole groups and the corresponding six-membered  $C_5OS$  rings are 56.8 (1) and 52.9 (1) $^\circ$  while the dihedral angles S2-C3-C1-C2 and S4-C16-S3-C15 are -11.7 (2) and -16.3 (2) $^\circ$ . In the crystal structure, intermolecular C—H $\cdots$ O and C—H $\cdots$ N hydrogen bonds (Table 2) link the molecules in a stacked arrangement along the  $a$  axis (Fig. 2).

### Experimental

CS2 (2.0 g, 26.3 mmol) was dropwise added to a solution of 1-(2,4-difluorophenyl)-2-(1H-1,2,4-triazol-1-yl) ethanone (5 g, 22.4 mmol) in DMSO (20 ml) containing NaOH (1.8 g, 45 mmol). The yellow solution was stirred for about 2 h at room temperature. Then bromethyl (2.5 g, 22.4 mmol) was dropwise added to the intermediate. After 3 h, the solution was poured into water (50 ml). The crystalline product was isolated by filtration, washed with water (300 ml). The crystals were obtained by dissolving the product in acetone (20 ml) and evaporating acetone slowly at room temperature for about 7 d.

### Refinement

The H atoms were positioned geometrically with C—H = 0.93 Å for aromatic H atoms, C—H = 0.97 Å for methylene H atoms, and with C—H = 0.96 Å for methyl H atoms, and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C}/\text{O})$ , where  $x = 1.2$  for aromatic and methylene H atoms and  $x = 1.5$  for the other H atoms.

### Figures

$\gamma$ = 79.36 (3)°	Block, yellow
V = 1347.0 (5) Å <sup>3</sup>	0.30 × 0.20 × 0.10 mm

### Data collection

Enraf–Nonius CAD-4 diffractometer	3725 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}} = 0.020$
graphite	$\theta_{\text{max}} = 25.3^\circ$ , $\theta_{\text{min}} = 1.4^\circ$
$\omega/2\theta$ scans	$h = 0 \rightarrow 9$
Absorption correction: $\psi$ scan (North <i>et al.</i> , 1968)	$k = -13 \rightarrow 13$
$T_{\text{min}} = 0.888$ , $T_{\text{max}} = 0.961$	$l = -18 \rightarrow 18$
5271 measured reflections	3 standard reflections every 200 reflections
4892 independent reflections	intensity decay: 1%

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.044$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.135$	H-atom parameters constrained

$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.087P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
4892 reflections	$(\Delta/\sigma)_{\max} < 0.001$
361 parameters	$\Delta\rho_{\max} = 0.21 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.29 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
