Received 25 August 2010; accepted 31 August 2010

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$;
 R factor = 0.014; wR factor = 0.038; data-to-parameter ratio = 20.0.

The molecule of the title compound, $\text{C}_{14}\text{H}_8\text{I}_2$, an intermediate in the synthesis of organic materials, is nearly planar, the maximum deviation from the mean plane being $0.032(1)\text{ \AA}$ for the C atoms and $0.082(2)\text{ \AA}$ for the I atoms. In the crystal structure, a sandwich–herringbone arrangement of molecules is observed, whereas a columnar π -stacking arrangement has been reported for the chlorinated congener 1,8-dichloroanthracene. Similar effects of halogen substituents on the modulation of packing arrangements are reported for halogenated aromatic compounds such as tetracenes and chrycenes.

1,8-Diidoanthracene

W. Nakanishi, S. Hitosugi, A. Piskareva and H. Isobe

Comment

Acenes are important compounds for the development of organic electronics, and the halogenated derivatives are of topical interest due to the unique packing arrangements (Moon *et al.*, 2004; Isobe *et al.*, 2009). The crystal structure of 1,8-dihaloanthracenes has been reported only for a chlorinated compound (Desvergne *et al.*, 1978; Benites *et al.*, 1996), and a columnar π -stacking arrangement of the molecules in the crystal has been revealed. We obtained a single-crystal of 1,8-diidoanthracene and found a sandwich-herringbone arrangement of the molecules in the crystal. The molecular structure is shown in Fig. 1, and the packing structure is shown in Fig. 2. The distance of π -stacking between the sandwiched dimer is 3.401 Å. The CH- π and halogen- π distances for the herringbone contacts are 2.908 (7) and 3.446 (3) Å, respectively.

Experimental

The title compound was synthesized from 4,5-diido-9-anthrone by a procedure similar to those reported in literatures (Lovell *et al.*, 1997; Goichi *et al.*, 2005). A single-crystal suitable for X-ray crystallographic analysis was obtained by recrystallization from a mixture of hexanes and dichloromethane (5:1).

Refinement

H atoms were included in calculated positions and treated as riding atoms, with C—H = 0.9 Å (aromatic) and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figures

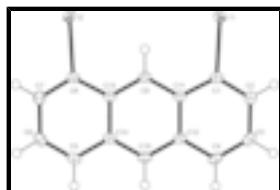

Fig. 1. The molecular structure of the title compound with displacement ellipsoids drawn at the 50% probability level.

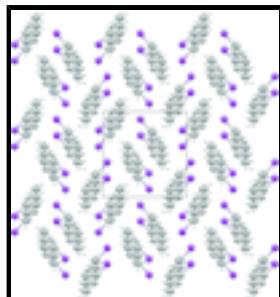

Fig. 2. The sandwich-herringbone packing of the title compound, viewed along the a axis.

13646 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.014$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.038$	H-atom parameters constrained
$S = 1.09$	$w = 1/[\sigma^2(F_o^2) + (0.0197P)^2 + 0.8912P]$
2904 reflections	where $P = (F_o^2 + 2F_c^2)/3$
145 parameters	$(\Delta/\sigma)_{\text{max}} = 0.005$
0 restraints	$\Delta\rho_{\text{max}} = 0.62 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.63 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
