Correspondence e-mail: jjasinski@keene.edu

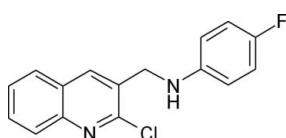

Received 14 August 2010; accepted 7 September 2010

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.002$  Å;  $R$  factor = 0.034;  $wR$  factor = 0.094; data-to-parameter ratio = 21.7.

In the title compound,  $C_{16}H_{12}ClFN_2$ , the dihedral angle between the quinoline ring system and the fluorophenyl ring is  $86.70(4)^\circ$ . In the crystal, molecules are linked into chains along the  $a$  axis by  $N-H \cdots N$  hydrogen bonds. In addition,  $C-H \cdots \pi$  interactions involving the two benzene rings are observed.

### N-[**(2-Chloro-3-quinolyl)methyl**]-4-fluoroaniline

**J. P. Jasinski, A. E. Pek, C. S. Chidan Kumar, H. S. Yathirajan and S. Kumar**

#### Comment

Quinoline derivatives represent a major class of heterocycles, and a number of preparations using them have been known since the late 1800s. Quinolines are found in natural products (Morimoto *et al.*, 1991; Michael *et al.*, 1997), numerous commercial products, including fragrances, dyes (Padwa *et al.*, 1999) and biologically active compounds (Markees *et al.*, 1970; Campbell *et al.*, 1988). Quinoline alkaloids such as quinine, chloroquin, mefloquine and amodiaquine are used as efficient drugs for the treatment of malaria (Robert & Meunier, 1998). Several quinoline derivatives have been evaluated *in vitro* against a number of parasites of HTLV-1 transformed cells. 2-Chloro substituted quinolines are vital synthetic intermediates in the construction of a large number of linearly fused tri- and tetra-cyclic quinolines studied for the DNA intercalating properties (Meth-Cohn *et al.*, 1981; Rajendran & Karavembu, 2002; Dutta *et al.*, 2002). A review on recent progress in the synthesis of quinolines (Kouznetsov *et al.*, 2005) has been described. The crystal structure studies of 8-chloro-2-methylquinoline (Wu *et al.*, 2009), 2-chloro-4-methylquinoline (Lynch *et al.*, 2001), 4-chloro-8-(trifluoromethyl)quinoline (Yathirajan *et al.*, 2007), 1-(quinolin-2-yl)ethanone (Butcher *et al.*, 2007) and 2-chloro-7-methylquinoline-3-carbaldehyde (Subashini *et al.*, 2009) have been reported. In view of the importance of quinolines, the paper reports the synthesis and crystal structure of the title compound.

In the title molecule (Fig. 1), the 2-chloroquinoline ring system and 4-fluoroaniline ring are bonded to a methane carbon, C10. The dihedral angle between the mean planes of the planar chloroquinoline ring system (dihedral angle between rings = 0.92 (5)°) and the fluorophenyl ring is 86.70 (4)°. Bond distances (Allen *et al.*, 1987) and angles are in normal ranges.

The molecules are linked into chains along the *a* axis by N—H···N hydrogen bonds (Fig. 2). In addition, C—H···π interactions involving the two benzene rings (Table 1) influence crystal packing in the unit cell.

#### Experimental

In a mixture of 3-(chloromethyl)-2-chloroquinoline (0.003 mol) and substituted phenyl amine (0.003 mol) in 20 ml of absolute ethanol, 1 ml of triethylamine (TEA) was added and refluxed for 12–15 hrs (Fig. 3). After completion of the reaction, content of the flask was reduced to half and left overnight. The crystalline mass obtained was filtered off, washed with water, dried and re-crystallized from ethanol to give *N*-[(2-chloroquinolin-3-yl)methyl]-4-fluoroaniline. X-ray quality crystals were obtained by slow evaporation of a methanol solution (m.p. 413–415 K).

#### Refinement

All of the H atoms were placed in their calculated positions and then refined using the riding model with atom—H lengths of 0.93 Å (CH), 0.97 Å (CH<sub>2</sub>) or 0.86 Å (NH). Isotropic displacement parameters for these atoms were set to 1.2 times *U*<sub>eq</sub> of the parent atom.

### *Crystal data*

$\text{C}_{16}\text{H}_{12}\text{ClFN}_2$	$Z = 2$
$M_r = 286.73$	$F(000) = 296$
Triclinic, $P\bar{1}$	$D_x = 1.427 \text{ Mg m}^{-3}$
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
$a = 7.3661 (8) \text{ \AA}$	Cell parameters from 5222 reflections
$b = 8.8967 (9) \text{ \AA}$	$\theta = 2.5\text{--}31.0^\circ$
$c = 11.5129 (12) \text{ \AA}$	$\mu = 0.29 \text{ mm}^{-1}$
$\alpha = 68.704 (1)^\circ$	$T = 100 \text{ K}$
$\beta = 74.468 (1)^\circ$	Plate, colourless
$\gamma = 75.445 (1)^\circ$	$0.55 \times 0.50 \times 0.25 \text{ mm}$
$V = 667.25 (12) \text{ \AA}^3$	

### *Data collection*

Bruker APEXII CCD area-detector diffractometer	3930 independent reflections
Radiation source: fine-focus sealed tube	3633 reflections with $I > 2\sigma(I)$

graphite	$R_{\text{int}} = 0.014$
$\omega$ scans	$\theta_{\text{max}} = 31.4^\circ, \theta_{\text{min}} = 1.9^\circ$
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2008)	$h = -10 \rightarrow 10$
$T_{\text{min}} = 0.858, T_{\text{max}} = 0.932$	$k = -12 \rightarrow 12$
8162 measured reflections	$l = -16 \rightarrow 16$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.034$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.094$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0533P)^2 + 0.2404P]$ where $P = (F_o^2 + 2F_c^2)/3$
3930 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
181 parameters	$\Delta\rho_{\text{max}} = 0.49 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.30 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

Cg1 and Cg2 are the centroids of the C1—C6 and C11—C16 rings, respectively.

$D—\text{H}\cdots A$	$D—\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D—\text{H}\cdots A$
N2—H18 $\cdots$ N1 <sup>i</sup>	0.86	2.30	3.1353 (12)	165
C4—H4 $\cdots$ Cg2 <sup>ii</sup>	0.93	2.91	3.7494 (13)	151
C10—H10A $\cdots$ Cg1 <sup>iii</sup>	0.97	2.62	3.5365 (12)	157
C10—H10B $\cdots$ Cg2 <sup>iv</sup>	0.97	2.98	3.8083 (11)	145

Symmetry codes: (i)  $x-1, y, z$ ; (ii)  $-x+2, -y+1, -z+1$ ; (iii)  $-x+2, -y, -z+1$ ; (iv)  $-x+1, -y, -z+2$ .
