Received 26 August 2010; accepted 13 September 2010

Key indicators: single-crystal X-ray study; $T = 93\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$; disorder in solvent or counterion; R factor = 0.059; wR factor = 0.195; data-to-parameter ratio = 17.4.

In the title compound (systematic name: 9-ethoxy-10-methoxy-5,6-dihydro-1,3-dioxolo[4,5-g]isoquinolino[3,2-a]isoquinolin-7-i um iodide monohydrate), $2\text{C}_{21}\text{H}_{20}\text{NO}_4^+\cdot 2\text{I}^-\cdot \text{H}_2\text{O}$, two independent molecules pack in the unit cell, where interactions between the molecules are stabilized by weak intermolecular $\pi-\pi$ stacking interactions [centroid–centroid distances in the range 3.571 (4) to 3.815 (4) \AA]. Intermolecular C–H \cdots O interactions are also observed. The iodide anions are disordered with occupancy ratios of 0.94 (1):0.06 (1) and 0.91 (1):0.09 (1). The cationic molecule is planar in structure with a small torsion resulting from the dihydropyridine ring.

Related literature

For the synthesis of the title compound, see: Iwasa *et al.* (1997). The title compound is a derivative of the natural product berberine. 9-O-Ethylberberrubinium iodide monohydrate

P. Grundt, J. Pernat, B. Krivogorsky, M. A. Halverson and S. M. Berry

Comment

The title compound, a derivative of the natural product berberine, is of interest with respect to its anti-parasite activity and biological properties Chen *et al.* (2009). Of particular interest is the discovery that berberine and its analogs inhibit the growth of strains of the parasites Leishmania (Nkwengoua *et al.*, 2009, Acero *et al.*, 1995, Ghosh *et al.*, 1985), Trypanosoma (Nkwengoua *et al.*, 2009), and Plasmodium (Wright *et al.*, 2000, Iwasa *et al.*, 1998, Sheng *et al.*, 1997, McCall *et al.*, 1994). Based on these findings and in our continued effort to characterize compounds that may inhibit the life cycle of the parasite *Toxoplasma gondii* we have synthesized the 9-ethyl analog of berberine.

The title compound, $2(\text{C}_{21}\text{H}_{20}\text{NO}_4^+)$, $2(\text{I}^-)$, H_2O , crystallizes in the P-1 space group with two independent molecules in the unit cell. A solvent water molecule occupies the lattice at H-bonding distance from the disordered iodide (1.94 & 0.06) anions [O5—I1A 3.509 (6) and O5—I1B 3.600 (6) Å]. The compound crystallizes with a slightly twisted planar structure due to the dihydropyridine moiety, which results in torsion angles of 17.7 (5)° (C15A/C16A/C11A/C2A) and 6.1 (5)° (C15B/C16B/C11B/C2B) between the planes of the isoquinoline and benzodioxole moieties for molecules A and B respectively. The molecules are layered in the crystal lattice with normal π — π stacking distances between centroids of the rings of molecules A and B of 3.571 (4) Å (rings C6A/C7A/C8A/C9A/C15A/C16A to C2B/C11B/C12B/C13B/C14B/C18B), 3.839 (4) Å (rings N1A/C5A/C10A/C15A/C16A/C17A to N1B/C5B/C10B/C15B/C16B/C17B), and 3.686 (4) Å (rings C2A/C11A/C12A/C13A/C14A/C18A to C6B/C7B/C8B/C9B/C15B/C16B). Identical molecules neighboring each other are located at further stacking distances with the closest centroid distance of 3.815 (4) Å between molecules A to A and 3.949 (4) Å between molecules B to B.

Experimental

The title compound was prepared by vacuum pyrolysis of berberine hydrochloride followed by alkylation with ethyl iodide (Iwasa *et al.*, 1997). The crystals suitable for single-crystal X-ray diffraction were grown in DMSO-d6. The crystal was diffracted in the cold stream of an X-Stream 2000 Liquid nitrogen generator with an open-flow nitrogen cryostat with a nominal stability of 0.1 K.

Refinement

The H atoms were all located in a difference map, but those attached to carbon atoms were repositioned geometrically. The H atoms were initially refined with soft restraints on the bond lengths and angles to regularize their geometry (C—H in the range 0.93–0.98, O—H = 0.82 Å) and $U_{\text{iso}}(\text{H})$ (in the range 1.2–1.5 times U_{eq} of the parent atom), after which the positions were refined with riding constraints. The ethyl groups on the molecules were found to have some disorder, with the methylene carbon (C20B) demonstrating the largest thermal parameters. The disordered iodide anions were solved with two partially occupied positions. The anisotropic parameters U_{xy} were restrained for each of the iodide pairs during refinement.
