## [2,2'-Iminodiethanolato(2-)- $\left.\boldsymbol{\kappa}^{3} \mathrm{O}, \mathrm{N}, \mathrm{O}^{\prime}\right]$ -[4-(methoxycarbonylmethyl)phenyl]boron

Ahmed L. Zein, Louise N. Dawe and Paris E. Georghiou*<br>Department of Chemistry, Memorial University of Newfoundland, St Johns, NL, Canada A1B 3X7<br>Correspondence e-mail: parisg@mun.ca<br>Received 7 September 2010; accepted 21 September 2010<br>Key indicators: single-crystal X-ray study; $T=153 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.043 ; w R$ factor $=0.112$; data-to-parameter ratio $=10.0$.

The title compound, $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{BNO}_{4}$, was readily obtained from the reaction of methyl 4-boronobenzene acetate with ethanolamine. A combination of intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions leads to the pairwise association of molecules.

# [2,2'-Iminodiethanolato(2-)- $\left.\boldsymbol{K}^{3} O, N, O^{\prime}\right][4-($ methoxycarbonylmethyl)phenyl]boron 

A. L. Zein, L. N. Dawe and P. E. Georghiou

## Comment

Boron is known to be an important trace element in higher plants (Warrington, 1923) and boron-containing compounds have been shown to have a range of diverse biological acvtivities (Jabbour et al., 2004). The use of boron-containing reagents is also widespread in synthetic chemistry and this is due mainly to the pioneering work of H. C. Brown and coworkers and Suzuki and his coworkers (Miyaura \& Suzuki, 1995). Corey, Bakshi and Shibata (Corey et al., 1987) discovered that a chrial oxazaborolidine ("CBS" reagent) which contains both boron-nitrogen and boron-oxygen bonds was capable of effecting enantioselective reduction of prochiral ketones, imines, and oximes to produce chiral alcohols, amines, and amino alcohols in excellent yields and ee's. Corey's group has also shown that chiral oxazaborolidine-aluminium bromide complexes (Liu et al. 2007) are also effective catalysts for enantioselective Diels-Alder reactions. In principle, oxazaborolidines are derived from reactions of a boronic acid and aminoalcohols and a less well known application of oxazaborolidines is to facilitate the conversion of a pinacolatoborane, by mild acid-catalysis (Jung \& Lazarova, 1999), to the corresponding boronic acid, a key step for cupric acetate promoted coupling of an arylboronic acids with phenols (Chan et al., 1998; Evans et al., 1998; Lam et al. 1998).

There has been only one reported X-ray crystallographic study of the structure of a diethanolamine ester of a phenylboronic acid (1) (Rettig \& Trotter, 1975). This compound which was named as B-phenyl-diptychboroxazolidine (alternative names: Tetrahydro-[1,3,2]oxaza-borol[2,3-b][1,3,2]oxazaborole; [[2,2'-(Imino-kN)bis[ethanolato-kO]](2)]phenylboron) was measured on a diffractometer with $\mathrm{Cu} K_{a}$ radiation and it was revealed to be non-centrosymmetric and in the $P 2_{1}$ space group. The absolute configuration of the enatiomorphic crystal was determined in this study. In connection with our own work (Wang \& Georghiou, 2002), crystals of (2), the corresponding diethanolamine ester of the 4-boronic acid derivative of methyl phenylacetate, were obtained and the structure of the molecule is reported here.

Methyl $p$-[[2,2'-iminobis[ethanolato]](2-)- $\left.N, O, O^{\prime}\right]$ phenylacetateboron (2; Figure 1) crystallized in the non-centrosymmetric space group $P 2{ }_{1} 2_{1} 21$, however, data collection was performed using molybdenum radiation, and the absolute configuration could not be determined due to the lack of an atom with significant anomalous dispersion. Intermolecular hydrogen bonding between $\mathrm{N} 1-\mathrm{H} 1 \cdots \mathrm{O} 2^{\mathrm{i}}\left(\mathrm{N} 1 \cdots \mathrm{O} 2^{\mathrm{i}}=2.921\right.$ (2) $\AA$ ) and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions between $\mathrm{C} 10-\mathrm{H} 10 \mathrm{~B} \cdots \mathrm{Cg} 3^{\mathrm{ii}}$ $\left(\mathrm{C} 10 \cdots C g 3^{\mathrm{ii}}=3.618(2)\right.$; where $C g 3$ is the centroid of $\left.\mathrm{C} 1-\mathrm{C} 6\right)$ leads to the pair-wise association of molecules (Figure 2). These molecular associates are related via the twofold screw axes in the crystal structure (viewed perpendicular to the $b$ axis in Figure 3).

## Experimental

To a solution of $\mathrm{PdCl}_{2}(\mathrm{dppf})(160 \mathrm{mg}, 0.18 \mathrm{mmol})$ in dioxane $(24 \mathrm{ml})$ was added methyl 4 -(trifluoroacetoxyacetate $(1.58 \mathrm{~g}$, $5.93 \mathrm{mmol}), \mathrm{Et}_{3} \mathrm{~N}(2.49 \mathrm{ml}, 17.8 \mathrm{mmol})$ and 4,4,5,5-tetramethyl-1,3,2-dioxaborolane ( $1.30 \mathrm{ml}, 8.9 \mathrm{mmol}$ ). After stirring for 20 h at $100^{\circ} \mathrm{C}$, the reaction mixture was extracted with benzene. The extract was purified by flash column chromatography
(silica gel, $10 \% \mathrm{EtOAc}$ in hexanes) to afford the arylboronate $(1.47 \mathrm{~g}, 90 \%){ }^{1} \mathrm{HNMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 1.34(\mathrm{~s}, 12 \mathrm{H}), 3.64$ $(\mathrm{s}, 2 \mathrm{H}), 3.67(\mathrm{~s}, 3 \mathrm{H}), 7.27(\mathrm{~d}, J=10 \mathrm{~Hz}, 2 \mathrm{H}), 7.77(\mathrm{~d}, J=10 \mathrm{~Hz}, 2 \mathrm{H})$. To a solution of the arylboronate $(1.47 \mathrm{~g}, 5.3 \mathrm{mmol})$ in diethylether $(53 \mathrm{ml})$ was added diethanolamine $(0.6 \mathrm{ml}, 5.8 \mathrm{mmol})$ in 2-propanol $(10 \mathrm{ml})$. The resulting mixture was stirred at ambient temperature for 72 h , the reaction mixture was then filtered and the solid was washed with diethyl ether to give cyclic aminoarylboronate ( $1.08 \mathrm{~g}, 77 \%$ ) as a colorless powder. Crystals suitable for X-ray diffraction analysis were obtained by crystallization from ethyl acetate solution. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 2.49-2.51(\mathrm{~m}, 2 \mathrm{H}), 2.96-3.03(\mathrm{~m}, 2 \mathrm{H}), 3.58(\mathrm{~s}$, $2 \mathrm{H}), 3.63(\mathrm{~s}, 3 \mathrm{H}), 3.70-3.72(\mathrm{~m}, 2 \mathrm{H}), 3.79-3.74(\mathrm{~m}, 2 \mathrm{H}), 5.83(\mathrm{~s}, 1 \mathrm{H}), 7.14(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.43(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR 41.0, 51.1, 51.8, 63.2, 128.3, 132.7, 132.8, 172.6.

## Refinement

H atoms were found in difference Fourier maps and subsequently placed in idealized positions with constrained distances and with $U_{\text {iso }}(\mathrm{H})$ values set to either 1.2 Ueq or 1.5 Ueq of the attached atom. They were refined on a riding model. All nonhydrogen atoms were refined anisotropically. This crystal was a weak anomalous scatterer collected with MoKa radiation, therefore, Friedel mates were merged (MERG 4) and absolute configuration was not determined.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

## supplementary materials

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.

Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$ factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.

The crystal was a weak anomalous scatterer collected with Mo K $\alpha$ radiation. Friedel mates were merged (MERG4) and the absolute configuration was not determined.
