Received 25 September 2010; accepted 4 October 2010

Key indicators: single-crystal X-ray study; $T = 273$ K; mean $\sigma(\text{N}-\text{C}) = 0.003$ Å; R factor = 0.026; wR factor = 0.070; data-to-parameter ratio = 10.0.

In the title compound, $\{[\text{Fe}(\text{C}_2\text{N}_{10})(\text{H}_2\text{O})_4]\cdot 2\text{H}_2\text{O}\}_n$, the coordination geometry around the Fe(II) atom, which lies on a center of inversion, is distorted octahedral, with bonds to four O atoms and two N atoms. The azotetrazolate ligand displays a bridging coordination mode, forming an infinite zigzag chain. Intermolecular O—H···O and O—H···N hydrogen bonding and offset face-to-face π – π stacking interactions [centroid–centroid distance = 3.4738(13) Å] lead to a three-dimensional network.

Comment

After Thiele prepared metallic salts of azotetrazole and claimed these for use in initiators, salts of AT²⁻ (AT = 5,5'-azotetrazolate) have been extensively investigated and have often been considered for practical use as a class of energetic materials. We report here the crystal structure of the title compound, [Fe(C₂N₁₀)(H₂O)₄.2H₂O]_n, (I).

Single-crystal analysis shows that (I) exists as a one-dimensional infinite chain. As shown in Figure 1, the coordination geometry around Fe²⁺ cation can be described a disordered octahedral arrangement with coordination number of 6, where O1, O2, O1A and O2A form the equatorial plane, and axial positions are occupied by N1 and N1A. Additionally, each AT²⁻ provides two terminal nitrogen atoms (N1 and N1A) acting as bridging ligand to connect two [Fe(H₂O)₄]²⁺ to form an infinite zigzag chain.

In the crystal structure, the interactions of hydrogen bonding between the water molecules and the N atoms in the terazole rings, the off-set face to face π - π stacking interactions of the terazole rings link the complex to a three dimensional structure, as shown in Figure 2.

Experimental

Brown block-like crystal for X-ray diffraction analysis was obtained from the mixture of (NH₄)₂Fe(SO₄)₂.6H₂O (0.392 g, 1 mmol), Na₂AT.5H₂O (0.304 g, 1 mmol) and distilled H₂O (20 ml), which was allowed to evaporate at room temperature for one week.

Refinement

H atoms attached to O atoms were placed in calculated positions, with O—H distances of 0.86 Å. The $U_{\text{iso}}(\text{H})$ values were constrained to be -1.5Ueq of the carrier atom.

Figures

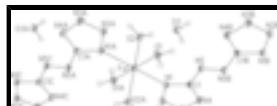

Fig. 1. A view of the molecular structure of (I) with the atom-labelling scheme. Displacement ellipsoids are drawn at the 30% probability level and H atoms are shown as small spheres of arbitrary radii.

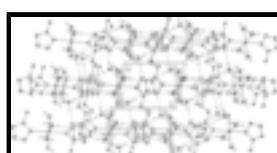

Fig. 2. Three dimensional network of the title complex.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.026$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.070$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.13$	$w = 1/[\sigma^2(F_o^2) + (0.0447P)^2 + 0.0115P]$ where $P = (F_o^2 + 2F_c^2)/3$
1061 reflections	$(\Delta/\sigma)_{\text{max}} = 0.007$
106 parameters	$\Delta\rho_{\text{max}} = 0.24 \text{ e \AA}^{-3}$
6 restraints	$\Delta\rho_{\text{min}} = -0.35 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
