Received 14 October 2010; accepted 15 October 2010

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C–C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.038;  $wR$  factor = 0.117; data-to-parameter ratio = 19.2.

The full molecule of the title compound,  $C_{12}H_{10}Cl_2N_2S_2$ , is generated by the application of a centre of inversion. The thiophene and imine residues are co-planar [the  $\text{N}–\text{C}–\text{C}–\text{S}$  torsion angle is  $-2.5(4)^\circ$ ] and the conformation about the imine bond [ $1.268(4)\text{ \AA}$ ] is *E*. Supramolecular arrays are formed in the *bc* plane via  $\text{C}–\text{Cl}\cdots\pi$  interactions and these stack along the *a* axis.

#### Comment

Interest in their putative biological activity (Wardell *et al.*, 2010) motivates studies of 2-substituted thiophene rings (Campaigne, 1984; Kleemann *et al.*, 2006), including on-going crystallographic investigations (Wardell *et al.* 2010; Prasath *et al.*, 2010).

The asymmetric unit of (I), Fig. 1, comprises half a molecule with the full molecule generated by a crystallographic centre of inversion. The thiophene residue is co-planar with the imine group as seen in the value of the N1—C2—C3—S1 torsion angle of -2.5 (4) °. The conformation about the imine N1—C2 [1.268 (4) Å] bond is *E*. The observed conformation matches closely those found for related compounds (Wang *et al.*, 2007; Prasath *et al.*, 2010).

The most prominent contacts in the crystal packing are of the type C—Cl···π, Table 1. These serve to connect molecules into a 2-D array in the *bc* plane, Fig. 2, which stack along the *a* axis, Fig. 3, with the chlorido atoms facing each other. Concerning the latter, the closest interlayer Cl···Cl contact is 3.3831 (11) Å [symmetry operation: 2 - *x*, -1/2 + *y*, 3/2 - *z*].

#### Experimental

A mixture of 5-chloro-2-thiophenecarboxaldehyde (0.43 ml, 0.004 *M*) and ethylenediamine (0.13 ml, 0.002 *M*) was stirred in dichloromethane for 3 h at room temperature. The solvent from the reaction mixture was removed under reduced pressure. The resulting solid was dried and purified by column chromatography using a 1:3 mixture of ethyl acetate and hexane. Recrystallization was by slow evaporation of a dichloromethane solution of (I) which yielded colourless needles (yield: 73%). *M. pt.* 353–355 K.

#### Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.95 to 0.99 Å) and were included in the refinement in the riding model approximation, with *U*<sub>iso</sub>(H) set to 1.2*U*<sub>equiv</sub>(C). In the final refinement a low angle reflection evidently effected by the beam stop was omitted, *i.e.* (100).

#### Figures

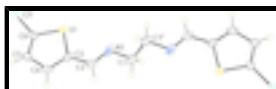

Fig. 1. Molecular structure of (I) showing the atom-labelling scheme and displacement ellipsoids at the 50% probability level. Symmetry operation *i*: 1 - *x*, 1 - *y*, 1 - *z*.

### Crystal data

$\text{C}_{12}\text{H}_{10}\text{Cl}_2\text{N}_2\text{S}_2$	$F(000) = 324$
$M_r = 317.24$	$D_x = 1.518 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Hall symbol: -P 2ybc	Cell parameters from 2363 reflections
$a = 14.682 (2) \text{ \AA}$	$\theta = 3.0\text{--}28.0^\circ$
$b = 4.7016 (7) \text{ \AA}$	$\mu = 0.75 \text{ mm}^{-1}$
$c = 10.6607 (15) \text{ \AA}$	$T = 100 \text{ K}$
$\beta = 109.439 (2)^\circ$	Prism, colourless
$V = 693.92 (17) \text{ \AA}^3$	$0.25 \times 0.15 \times 0.05 \text{ mm}$
$Z = 2$	

### Data collection

Bruker SMART APEX diffractometer	1576 independent reflections
Radiation source: fine-focus sealed tube graphite	1270 reflections with $I > 2\sigma(I)$
$\omega$ scans	$R_{\text{int}} = 0.058$
Absorption correction: multi-scan ( <i>SADABS</i> ; Sheldrick, 1996)	$\theta_{\text{max}} = 27.5^\circ, \theta_{\text{min}} = 2.9^\circ$
$T_{\text{min}} = 0.835, T_{\text{max}} = 0.963$	$h = -18\text{--}18$
5721 measured reflections	$k = -6\text{--}6$
	$l = -13\text{--}13$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.038$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.117$	H-atom parameters constrained

$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0662P)^2 + 0.3727P]$
	where $P = (F_o^2 + 2F_c^2)/3$
1576 reflections	$(\Delta/\sigma)_{\max} = 0.001$
82 parameters	$\Delta\rho_{\max} = 0.36 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.48 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
