Received 26 October 2010; accepted 28 October 2010

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; disorder in main residue; R factor = 0.039; wR factor = 0.119; data-to-parameter ratio = 16.2.

In the title molecule, $\text{C}_{10}\text{H}_{15}\text{NO}_3\text{S}$, the S atom is bonded in a distorted tetrahedral geometry. In the crystal structure, intermolecular $\text{N}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{O}$ and weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds connect the molecules to form a two-dimensional network parallel to (100). The 2-methylpropan-1-ol group is disordered over two orientations with occupancies of 0.570 (3) and 0.430 (3).

N-(2-Hydroxy-1,1-dimethylethyl)benzenesulfonamide

Aziz-ur-Rehman, N. Abbas, M. Akkurt, M. A. Abbasi, S. Sharif and I. U. Khan

Comment

The sulfonamide moiety is found in a number of synthetic as well as natural compounds and renders various biological activities in these compounds (Ozbek *et al.*, 2007, Parari *et al.*, 2008). In continuation of our structural studies on various sulfonamide derivatives (Asiri *et al.*, 2009, Aziz-ur-Rehman *et al.*, 2010) herein we report the crystal structure of the title compound (I).

The molecular structure of (I) is shown in Fig. 1 and reveals a distorted tetrahedral geometry around the S atom [maximum deviation from the ideal sp^3 hybridized geometry for O—S—O = 119.29 (8) $^\circ$]. There are weak intramolecular C—H···O contacts within the molecule. In the crystal structure, intermolecular N—H···O, O—H···O and weak C—H···O hydrogen bonds connect the molecules to form a two-dimensional network parallel to (100) (Fig. 2).

Experimental

A mixture of benzenesulfonyl chloride (10.0 mmol; 1.28 ml), 2-amino-2-methyl propanol (10.0 mmol; 0.95 ml), aqueous sodium carbonate (10%; 15.0 ml) and water (20 ml) was stirred for one and half hours at room temperature. The crude mixture was washed with distilled water and dried. The product was dissolved in methanol and recrystallized by slow evaporation of the solvent, to generate colourless crystals of *N*-(2-hydroxy-1,1-dimethylethyl)benzenesulfonamide in 65% yield.

Refinement

All H atoms were positioned geometrically with N—H = 0.86, O—H = 0.82 and C—H = 0.93–0.97 Å and allowed to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C, N})$ or $1.5U_{\text{eq}}(\text{Cmethyl,O})$. The 2-methylpropan-1-ol group of the title molecule show disorder over two sets of sites with an occupancy ratio of 0.570 (3):0.430 (3).

Figures

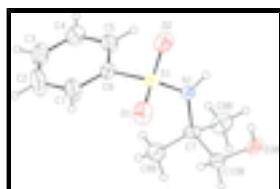

Fig. 1. The molecular structure of (I) with displacement ellipsoids drawn at the 30% probability level. The disorder is not shown.

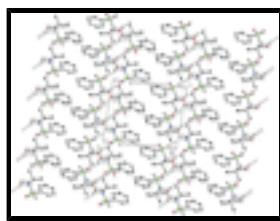

Fig. 2. Part of the crystal structure of (I) H atoms not involved in hydrogen bonds (dashed lines) have been omitted for clarity and only the major component of the disorder is shown.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.119$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0674P)^2 + 0.1878P]$ where $P = (F_o^2 + 2F_c^2)/3$
2857 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
176 parameters	$\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$
8 restraints	$\Delta\rho_{\text{min}} = -0.33 \text{ e \AA}^{-3}$

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The

observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating - R -factor-obs *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
