Received 27 October 2010; accepted 28 October 2010

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(C-C) = 0.004$ Å; R factor = 0.019; wR factor = 0.048; data-to-parameter ratio = 12.6.

In the title dinuclear complex, $[Dy_2(C_8H_7O_3)_6(C_{10}H_8N_2)_2 \cdot (H_2O)_2] \cdot H_2O$, the Dy^{III} atoms are coordinated by eight O atoms from four 2-(4-hydroxyphenyl)acetate (HPAA) ligands and one N atom from a 4,4'-bipyridine (bipy) ligand in a distorted tricapped trigonal prismatic geometry. Whereas four HPAA ligands coordinate to just two Dy^{III} atoms, the remaining two ligands bridge the two Dy^{III} atoms. In the crystal, $O-H\cdots O$ and $O-H\cdots N$ hydrogen bonds link the molecules into a three-dimensional network.

Comment

The design and synthesis of carboxylic metal-organic complexes have been an increasing interest for decades owing to their potential practical applications, such as fluorescence, magnetism (Wang *et al.*, 2010; Fang & Zhang, 2006; Wang *et al.*, 2008). We have worked at it before (Liu *et al.*, 2010). In the paper, we report the crystal structure of a new dysprosium ^{III} complex with the ligand *p*-hydroxyphenylacetic acid. The title compound consist of two Dy (III) cation, six *L* ligands, two bipy molecules and three water molecules. In the bicentric structure compound, every centric atom is coordinated with seven O atoms from four *L* ligands, one N atom from 4,4'-bipyridine ligand and one O atom from a water molecule. The centric atom is nine coordinated. The PAA ligands are coordinated by two modes, bridging and bridging tridentate. (Fig.1). The dysprosium ^{III} atom is in a distorted capped pentagonal prism environment. The Dy–O bond lengths range from 2.3875 (16) Å-2.5555 (16) Å. The Dy–N distances range from 2.494 (3) Å-2.509 (3) Å. The Dy–O(water) bond length range are 2.5415 (19) Å and 2.5631(19) Å. In addition, there are plenty of hydrogen bonds in the crystal structure due to the existence of dissociative water and crystal water molecules. The occurrence of numerous O–H···O involving coordinated and non-coordinated water molecules build up a three dimensional network.

Experimental

All reagents and solvents used were of commercially available quality and without purified before using. *p*-hydroxyphenylacetic acid(HPAA) (0.456 g, 3 mmol) and sodium hydroxide (0.12 g, 3 mmol) were mixed together in water(10 ml), then Dy[(NO₃)₃](0.360 g, 1 mmol) dissolved in water(10 ml) was added into the above solution, after stirred for an hour, an ethanol(5 ml) solution of 4,4'-bipyridine(0.156 g, 1 mmol) is slowly dripped into the above solution with stirring for three hours. After filtration, the filtrate was allowed to stand at room temperature, and single crystals suitable for *X*-ray work were obtained after a week.

Refinement

All H atoms attached to C atoms and O(hydroxyl) atom were fixed geometrically and treated as riding with C–H = 0.97 Å (methylene) or 0.93 Å (aromatic) and O–H = 0.82 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. H atoms of the water molecules were located in a difference Fourier map and included in the refinement using restraints (O–H= 0.82 (1) Å and H···H= 1.39 (2) Å) with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.019$	Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.048$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0215P)^2 + 1.845P]$ where $P = (F_o^2 + 2F_c^2)/3$
11065 reflections	$(\Delta/\sigma)_{\max} = 0.002$
875 parameters	$\Delta\rho_{\max} = 0.32 \text{ e \AA}^{-3}$
9 restraints	$\Delta\rho_{\min} = -0.83 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
