Received 17 October 2010; accepted 2 November 2010

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(C-C) = 0.003$  Å;  $R$  factor = 0.018;  $wR$  factor = 0.044; data-to-parameter ratio = 16.3.

The title dinuclear complex,  $[Er_2(C_8H_7O_3)_6(C_{10}H_8N_2)_2 \cdot (H_2O)_2] \cdot H_2O$ , contains two Er<sup>III</sup> atoms in the asymmetric unit, six 2-(4-hydroxyphenyl)acetate (PAA) anions, two 4,4'-bipyridine (bipy) molecules, two coordinated water molecules and one solvent water molecule. The central Er<sup>III</sup> atoms are nine-coordinated. The coordination environment includes six O atoms from three PAA anions, one bridging O atom from a PAA anion, one O atom from a water molecule and an N atom from a bipy ligand in a distorted tricapped trigonal-prismatic geometry. The occurrence of numerous O—H···O and O—H···N hydrogen bonds involving coordinated and noncoordinated water as well as bipy groups builds up an intricate three-dimensional network.

### Comment

The design and synthesis of lanthanide carboxylic metal-organic complexes has been of interest for decades owing to their potential practical applications, such as fluorescence and magnetism. We recently published the structure of a thulium(III) complex with coordination provided by 2-(4-hydroxyphenyl)acetate and 1,10-phenanthroline. (Liu *et al.*, 2010). In this paper, we report the related crystal structure of a new erbium(III) complex with the ligand 2-(4-hydroxyphenyl)acetate and 4,4'-bipyridine instead of 1,10-phenanthroline. The dinuclear complex,  $[Er(C_8H_7O_3)_3(C_{10}H_8N_2)(H_2O)]_2 \cdot (H_2O)$ , contains two erbium(III) ions in the asymmetric unit, six 2-(4-hydroxyphenyl)acetate (PAA) anions, two 4,4'-bipyridine molecules (bipy), as well as two coordinated water molecules. There is one solvate water molecule. The central Er ions are nine coordinate. They have similar coordination spheres, which include six O atoms from three 2-(4-hydroxyphenyl)acetate ligands, one bridging O atom from a neighboring PAA ligand, one O atom from a water molecule and a N atom from bipy ligand in a distorted tricapped trigonal-prismatic geometry. In the species, the Er's are coordinated by two modes, bridging and bridging tridentate (Fig. 1). Each Er is in a distorted tricapped trigonal-prismatic geometry. Furthermore, the asymmetric unit contains one solvent water molecules (Fig. 1). The occurrence of numerous O—H $\cdots$ O and O—H $\cdots$ N hydrogen bonds involving coordinated and non-coordinated water as well as bipyridine groups builds up an intricate three-dimensionnal network (Table 1).

### Experimental

All reagents and solvents used were of commercially available quality and were used without further purification. Para-hydroxyphenylacetic acid (HPAA) (3 mmol) and sodium hydroxide (3 mmol) were mixed together in water (10 ml), then  $Er(NO_3)_3$  (1 mmol) dissolved in water (10 ml) was added into the above solution. After stirring for one hour, an ethanol (5 ml) solution of 4,4'-bipyridine (1 mmol) was slowly dripped into the above solution with stirring for three hours. After filtration, the filtrate was allowed to stand at room temperature, and single crystals suitable for X-ray work were obtained after one week.

### Refinement

All H atoms attached to C atoms and O(hydroxyl) atom were fixed geometrically and treated as riding with C—H = 0.97 Å (methylene) or 0.93 Å (aromatic) and O—H = 0.82 Å with  $U_{iso}(H) = 1.2U_{eq}(C)$  or  $U_{iso}(H) = 1.5U_{eq}(O)$ . H atoms of the water molecule were located in a difference Fourier map and included in the subsequent refinement using restraints (O—H = 0.82 (1) Å and H $\cdots$ H = 1.39 (2) Å) with  $U_{iso}(H) = 1.5U_{eq}(O)$ . In the last cycles of refinement they were treated as riding on their parent O atom.

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.018$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.044$	H atoms treated by a mixture of independent and constrained refinement

$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0177P)^2 + 1.8781P]$
	where $P = (F_o^2 + 2F_c^2)/3$
14291 reflections	$(\Delta/\sigma)_{\max} = 0.002$
875 parameters	$\Delta\rho_{\max} = 0.41 \text{ e } \text{\AA}^{-3}$
9 restraints	$\Delta\rho_{\min} = -0.79 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
