Received 8 November 2010; accepted 11 November 2010

Key indicators: single-crystal X-ray study;  $T = 294\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.029;  $wR$  factor = 0.072; data-to-parameter ratio = 18.2.

In the title compound,  $[\text{Cu}(\text{C}_{16}\text{H}_{36}\text{N}_4)](\text{C}_6\text{H}_4\text{O}_2\text{PS}_2)_2$ , the  $\text{Cu}^{\text{II}}$  cation lies on an inversion center and is chelated by the macrocyclic tetraamine ligand in a slightly distorted  $\text{CuN}_4$  square-planar geometry. The axial positions are occupied by two  $O,O'-(*o*-phenylene)dithiophosphate anions with long  $\text{Cu}\cdots\text{S}$  distances of  $3.0940(7)\text{ \AA}$ . Intermolecular  $\text{N}-\text{H}\cdots\text{S}$  and  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonding is present between the anions and the cation and helps to stabilize the crystal structure.$

**Comment**

The synthesis and structural investigation of tetraamine macrocycle have attracted much attention due to their wide potential applications (Groeta *et al.*, 2000; Aoki & Kimura, 2002). In our quest for mimetic hydrolases, we have recently reported several structures of tetraamine macrocyclic transition metal adducts with O,O'-dialkyldithiophosphate (Feng *et al.*, 2009; Xie *et al.*, 2009; He *et al.*, 2010). Herein, we report the structure of  $[\text{Cu}(\text{meso-hmta})]_2[(o\text{-C}_6\text{H}_4\text{O}_2)\text{PS}_2]_2$ , where meso-hmta is *meso*-5,5,7,12,12,14-hexamethyl-1,4,8,11-tetraazacyclotetradecane.

The molecular of the title adduct comprises a complex mononuclear  $[\text{Cu}(\text{meso-hmta})]^{2+}$  cation and two  $O,O'$ -(1,2-phenylene)dithiophosphate anions. Its structure is remarkably similar to the analogues,  $[\text{Cu}(\text{trans-[14]dien})][\text{S}_2\text{P}(\text{OC}_6\text{H}_4\text{Me-4})_2]_2$  (He *et al.*, 2010), where *trans*-[14]dien is *meso*-5,7,7,12,14,14-hexamethyl-1,4,8,11-tetraazacyclotetradeca -4,11-diene. The Cu<sup>II</sup> atom lies on an inversion center and is chelated by tetraamine macrocycle ligand with a relatively undistorted  $\text{CuN}_4$  square-planar geometry (Fig.1). Two uncoordinated  $O,O'$ -(1,2-phenylene)dithiophosphate anions occupy at the axial positions with the longer Cu···S distances of 3.0940 (7) Å, forming an octahedral asymmetric unit. Intermolecular N—H···S hydrogen bonding is present between the anions and the cation and help to stabilize the crystal structure (Table 1). The strain in the  $O,O'$ -(1,2-phenylene)dithiophosphate anions is illustrated by the distorted tetrahedral angles of P atoms, which range between 94.43 (7) and 120.01 (4)°.

**Experimental**

$[\text{Et}_3\text{NH}]_2[(o\text{-C}_6\text{H}_4\text{O}_2)\text{PS}_2]$  was prepared by adding  $\text{P}_2\text{S}_5$  (0.05 mol, 11.1 g) and catechol (0.1 mol, 11 g) to a solution of triethylamine (15 mL) in 50 mL toluene with stirring. The mixture was stirred for 45 min at 368 K and then refluxed for 15 min. After cooled to room temperature, the precipitate was filtered off and washed successively with methanol, diethyl ether and acetone. The white crystalline product was obtained by recrystallization in hot methanol, yield 79%.

A solution of *meso*-5,5,7,12,12,14- hexamethyl-1,4,8,11- tetraazacyclotetradecane dihydrate (0.32 g, 1 mmol) and  $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$  (0.17 g, 1 mmol) in 20 ml methanol was quickly added to  $[\text{Et}_3\text{NH}]_2[(o\text{-C}_6\text{H}_4\text{O}_2)\text{PS}_2]$  (2 mmol, 0.61 g) dissolved in 20 ml hot methanol with stirring. The mixture was refluxed for 4 h and cooled to room temperature, the precipitate was filtered off, washed with diethyl ether and recrystallized from benzene to leave a dark-violet solid, which was dissolved in hot methanol and filtered. The filtrate was kept at room temperature and dark-violet block crystals of the title compound suitable for X-ray diffraction studies were obtained after a week.

## Refinement

H atoms on C and N atoms were fixed geometrically and treated as riding, with C—H = 0.98 (methine), 0.97 (methylene), 0.96 (methyl), 0.93 (aromatic) and N—H = 0.91 Å. The  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$  for the other H atoms.

## Figures

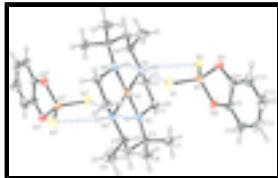

Fig. 1. The molecular structure of compound, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii. Hydrogen-bonds are shown as dashed lines [symmetry code: (i)  $-x + 1, -y + 1, -z + 1$ ].

## *Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.029$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.072$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0358P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
3621 reflections	$(\Delta/\sigma)_{\max} = 0.001$
199 parameters	$\Delta\rho_{\max} = 0.23 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.37 \text{ e \AA}^{-3}$

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
