Received 17 October 2010; accepted 12 November 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$; R factor = 0.095; wR factor = 0.232; data-to-parameter ratio = 16.6.

In the crystal structure of the title complex, $[\text{Al}(\text{CH}_3)_2(\text{C}_{17}\text{H}_{30}\text{N}_3)]$, the Al^{III} cation is coordinated by two methyl ligands and two N atoms from the guanidinato ligand in a distorted tetrahedral geometry. The dihedral angle between the CN_2 and AlC_2 planes is $85.37(2)^\circ$. The two N atoms of the guanidinato ligand exhibit an almost uniform affinity to the metal atom.

[1,1-(Butane-1,4-diyl)-2,3-dicyclohexylguanidinato]dimethylaluminum(III)

H. Li, Y. Xiang and H. Han

Comment

Since the first guanidinato complexes have been reported in 1970 by Lappert *et al.* (Chandra *et al.*, 1970), guanidinato ligands have been used extensively in the coordination chemistry of transition, f-block, and main-group metals (Corey *et al.*, 2006). Moreover many guanidinato complexes were reported showing good performance in ethylene polymerization (Zhou *et al.*, 2007) and in Ring-Opening Polymerisation (Coles & Hitchcock, 2004). It implied that the guanidinato complex would behave better in catalysis application.

There has been a great deal of research in directed ortho metalation reactions (Kondo *et al.*, 2007). We had expected guanidinato lithium, the result of the addition of N,N'-dicyclohexyl carbodiimide with N-tetrahydropyrrolyl lithium, when reacting with trimethyl aluminum, to produce a new kind of complex containing Al and Li atoms. However, X-ray diffraction on the complex obtained in the reaction revealed that the Li atom was replaced by Al atom surprisingly. Its molecular structure is shown in Fig. 1. In the molecular structure of the complex, the metal atom is chelated with the guanidinato ligand. The four-coordinate Al(III) center demonstrates a highly distorted tetrahedral geometry. The distances from the two N atoms to Al atom are almost equal [N1-Al: 1.918 (4) Å, N2-Al: 1.925 (4) Å]. It indicates that the two N atoms of guanidinato ligand exhibit almost uniform affinity to the metal center.

Experimental

A solution of N-tetrahydropyrrolyl lithium in diethylether (0.232g, 3mmol) was added dropwise with stirring at 273K to a solution of 0.619g (3mmol) of *N*,*N'*-dicyclohexyl carbodiimide in ether. The mixture was warmed to room temperature and stirred for 2h. A 2M solution of trimethylaluminum in hexane (1.5mL, 3mmol) was added at 195K to the mixed solution. The mixture was warmed to room temperature and stirred for 12h. Concentration of the filtrate under reduced pressure produced the colorless crystals suitable for X-ray analysis 3 days later (yield 0.620g, 62%).

Refinement

Positional parameters of all H atoms were calculated geometrically.

Figures

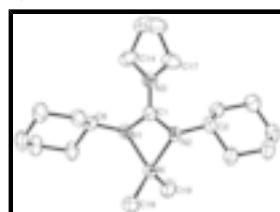

Fig. 1. The molecular structure, showing the atom–numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are presented as a small spheres of arbitrary radius.

Data collection

Bruker SMART CCD area-detector diffractometer	1772 independent reflections
Radiation source: fine-focus sealed tube graphite	1630 reflections with $I > 2\sigma(I)$
phi and ω scans	$R_{\text{int}} = 0.059$
Absorption correction: multi-scan (<i>SADABS</i> ; Sheldrick, 1996)	$\theta_{\text{max}} = 25.0^\circ, \theta_{\text{min}} = 2.2^\circ$
$T_{\text{min}} = 0.959, T_{\text{max}} = 0.969$	$h = -21\text{--}21$
7156 measured reflections	$k = -12\text{--}7$
	$l = -11\text{--}12$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.095$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.232$	H-atom parameters constrained
$S = 1.42$	$w = 1/[\sigma^2(F_o^2) + (0.P)^2 + 5.155P]$ where $P = (F_o^2 + 2F_c^2)/3$
1772 reflections	$(\Delta/\sigma)_{\text{max}} = 0.005$
107 parameters	$\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.43 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
