Received 7 November 2010; accepted 19 November 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.055; wR factor = 0.161; data-to-parameter ratio = 13.5.

There are two independent molecules in the asymmetric unit of the title compound, $C_{22}\text{H}_{14}\text{FN}_3$, which differ slightly in the relative orientations of the naphthyl and phenyl groups with respect to the pyridyl ring framework. In one molecule, the naphthyl ring system and the phenyl ring form dihedral of angles 56.50 (2) and 48.23 (3) $^\circ$, respectively, with the pyridyl ring plane. In the other molecule, the corresponding dihedral angles are 50.01 (2) and 51.1 (3) $^\circ$, respectively. In the crystal, intermolecular N—H···N hydrogen bonds connect the independent molecules into dimers.

2-Amino-4-(3-fluorophenyl)-6-(naphthalen-1-yl)pyridine-3-carbonitrile

J.-Y. Xu, Z.-C. Gao, K.-J. Sun and W.-H. Cheng

Comment

The title compound is an intermediate which can be used in many fields such as medicine (Moreau *et al.*, (1999). Herein we report its crystal structure. There are two independent molecules in an asymmetric unit of the title compound (Fig. 1), which differ slightly in the relative orientations of the naphthyl and phenyl groups with respect to the pyridyl ring framework. In one of the molecules, the naphthyl (C1—C10) and phenyl ring planes (C16 to C21) form torsion angles 56.50 (2) and 48.23 (3) $^{\circ}$, respectively, with the middle pyridyl ring plane. In the other molecule, the corresponding torsion angles are 50.01 (2) and 51.1 (3) $^{\circ}$, respectively. There are intermolecular N—H \cdots N hydrogen bonds, which connect the independent molecules into dimers (Fig. 2 and Tab. 1). In addition, there are weak C—H \cdots N intramolecular hydrogen bonds in each molecule.

Experimental

The title compound was prepared by the literature method (Mantri, 2008). Crystals suitable for X-ray analysis were obtained by dissolving the title compound (0.5 g) in methanol (20 ml) and evaporating the solvent slowly at room temperature in about 7 d.

Refinement

All H atoms were positioned geometrically and constrained to ride on their parent atoms, with C—H = 0.93 Å and N—H = 0.86 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}/\text{N})$.

Figures

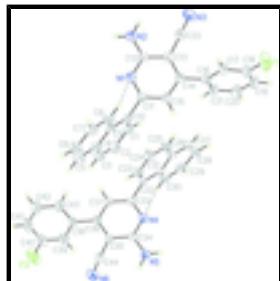

Fig. 1. A perspective drawing of the two molecules of the title compound. Displacement ellipsoids are drawn at the 50% probability level.

supplementary materials

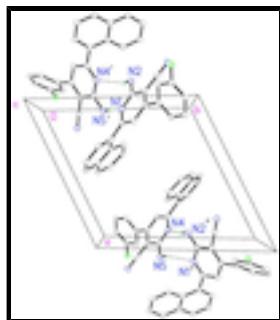

Fig. 2. Unit cell packing of the title compound showing dimers formed *via* hydrogen bonding. H atoms not involved in hydrogen bonds have been omitted for clarity. Symmetry codes: (i) $x - 1, y, z$; (ii) $x + 1, y, z$.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.055$	H-atom parameters constrained
$wR(F^2) = 0.161$	$w = 1/[\sigma^2(F_o^2) + (0.087P)^2]$
	where $P = (F_o^2 + 2F_c^2)/3$

$S = 1.00$	$(\Delta/\sigma)_{\max} < 0.001$
6327 reflections	$\Delta\rho_{\max} = 0.18 \text{ e \AA}^{-3}$
470 parameters	$\Delta\rho_{\min} = -0.20 \text{ e \AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.019 (2)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
