Received 26 November 2010; accepted 29 November 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{N}-\text{N}) = 0.003\text{ \AA}$; R factor = 0.027; wR factor = 0.073; data-to-parameter ratio = 7.4.

The non-centrosymmetric crystal structure of the novel semi-organic title compound, $\text{C}_2\text{H}_5\text{N}_4^+\cdot\text{NO}_3^-$, is based on alternating layers of 4-amino-1*H*-1,2,4-triazolinium cations (formed by parallel chains of cations mediated by weak $\text{C}-\text{H}\cdots\text{N}$ hydrogen bonds) and nitrate anions interconnected via linear and bifurcated $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds and weak $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds. $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds link the anions and cations.

4-Amino-1*H*-1,2,4-triazol-1-i^{um} nitrate

I. Matulková, I. Cíšarová and I. Nemec

Comment

The 1,2,4-triazole moiety as a part of ligand system in metal complexes has gained considerable attention in recent years (Sinditskii *et al.*, 1987; Haasnoot, 2000; Klingele & Brooker, 2003; Beckmann & Brooker, 2003; Muller *et al.*, 2003). The application of triazole ligand lies in the medical research – complex with Pt^{II} (Komeda *et al.*, 2003) exhibits antitumor activity. Triazole derivatives are also used in the synthesis of antibiotics, fungicides, herbicides, plant growth hormone regulators (Li *et al.*, 2004), and potentially prospective corrosion inhibitors (Mernari *et al.*, 1998; Bentiss *et al.*, 1999).

Materials based on triazole compounds with dicarboxylic acids (4-amino-1,2,4-triazol-1-i^{um} hydrogen oxalate, adducts of 4-amino-1,2,4-triazole with succinic acid and adipic acid and 3-amino-1,2,4-triazolinium hydrogen *L*-tartrate) were also prepared and characterized as promising compounds in the field of non-linear optics (Matulková *et al.*, 2008; Matulková *et al.*, 2007).

The non-centrosymmetric crystal structure of the title compound is based on alternating layers of 4-amino-1,2,4-triazolinium cations (formed by parallel chains of cations mediated by weak C—H···N hydrogen bonds) and nitrate anions inter-connected *via* linear and bifurcated N—H···O hydrogen bonds and weak C—H···O hydrogen bond. The donor···acceptor distances in these hydrogen bonds attain values from 2.710 (2) to 3.167 (3) Å (N—H···O bonds) and 3.398 (3) Å (C—H···O bond). The Fig. 1 contains atom-labelling of title compound and packing scheme of the crystal structure is presented in Fig. 2.

The bond length comparison of 4-amino-1,2,4-triazolinium cations in the title compound and 4-amino-1,2,4-triazol-1-i^{um} hydrogen oxalate (Matulková *et al.*, 2008) exhibits reasonable shortening of N1—N2 distance in the cation of the title compound compared to N2—N3 distance in the organic salt (1.359 (2) Å for 4-amino-1,2,4-triazol-1-i^{um} nitrate; 1.366 (2) Å for 4-amino-1,2,4-triazol-1-i^{um} hydrogen oxalate).

The nitrate anions are planar with O—N—O angles slightly different from theoretical values of 120° in the crystal structure of the title compound. These differences can be explained by unequal participation of oxygen atoms in N—H···O hydrogen bonds. The smaller angle values 119.7 (2) and 118.5 (2)° (*i.e.* angles O1—N7—O2 and O3—N7—O1) are connected with the existence of bifurcated hydrogen bonds influencing these parts of the anion. The remaining bond angle O2—N7—O3 shows a value of 121.8 (2)°. Similar differences can be also observed in the case of N—O bond distances - *i.e.* two short distances 1.232 (3) and 1.240 (2) Å (N7—O2 and N7—O3, respectively) and a longer one 1.263 (2) Å (N7—O1).

Experimental

4-Amino-1,2,4-triazole was prepared and purified by a slightly modified procedure described previously in the literature (Sanz *et al.*, 2002; Herbert *et al.*, 1953; Matulková *et al.*, 2008). The crystals of the title compound, were obtained from a solution of 0.1 g of 4-amino-1,2,4-triazole, 0.8 ml of 2 mol/dm³ nitric acid (68% p.a., Lachema) and 5 ml of water. The

supplementary materials

solution was left to crystallize at room temperature for several weeks. The colourless crystals obtained were filtered off, washed with methanol and dried in vacuum desiccator over KOH.

Refinement

H atoms attached to C atoms were calculated in geometrically idealized positions, with $C(sp^2)$ —H = 0.93 Å. The positions of H atoms attached to O and N atoms were localized on difference Fourier maps. All hydrogen atoms were constrained to ride on their parent atoms during refinement, with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}$ (pivot atom).

Figures

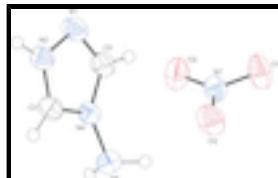

Fig. 1. The atom-labelling of the title compound. Displacement ellipsoids are drawn at the 50% probability level.

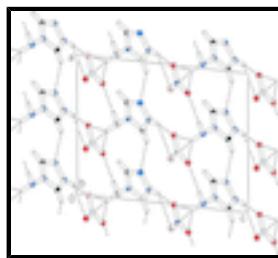

Fig. 2. A packing scheme of the title compound (projection to *ac* plane). Hydrogen bonds are indicated by dashed lines (C—H···O bonds are omitted for clarity).

92 parameters	$\Delta\rho_{\min} = -0.14 \text{ e Å}^{-3}$
2 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.104 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
