Received 25 November 2010; accepted 26 November 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.051; wR factor = 0.130; data-to-parameter ratio = 15.3.

In title compound, $\text{C}_{18}\text{H}_{21}\text{BrO}$, the dihedral angle between two rings is 85.72° . No classical hydrogen bonds are found and only van der Waals forces stabilize the crystal packing.

4-Bromo-2-[1-(4-ethoxyphenyl)-1-methylethyl]-1-methylbenzene

Y. Li, X. Kong, G.-H. Chen, J.-G. Chi and J.-N. Wang

Comment

SGLT2 inhibitors are a class of promising anti-hyperglycemic agents, and a variety of SGLT2 inhibitors are now in clinical trials (Meng *et al.*, 2008). The title compound was a crucial intermediate, the aglycon of the C-glucoside SGLT2 inhibitors, for the synthesis of novel C-glucoside SGLT2 inhibitors during the development of our own SGLT2 inhibitors (Gao *et al.*, 2010*a,b*).

In title compound, $C_{18}H_{21}BrO$, bond lengths are normal (Allen *et al.*, 1987). The dihedral angle between two phenyl ring (C2—C7 and C11—C16) is 85.72° . No classic hydrogen bonds found, only Van der Waals forces stabilize the crystal packing.

Experimental

A dried 100-ml round-bottomed flask was charged with 2.29 g (10 mmol) of 1-(5-bromo-2-methylphenyl)-1-methylethanol, 1.22 g (10 mmol) of phenetol and 15 ml of dried dichloromethane, and the clear solution thus obtained was stirred on an ice bath followed by addition of 1.33 g (10 mmol) of anhydrous aluminium chloride in a portionwise manner. After addition, the reaction mixture was stirred at room temperature for another one hour when TLC analysis indicated that all the starting materials were consumed completely. The reaction mixture was poured into 300 ml of ice-water and exacted with three 50-ml portions of dichloromethane, and the combined exacts were washed with saturated brine, dried over sodium sulfate and evaporated on a rotary evaporator to afford the crude product as a colorless oil, which was purified by column chromatography to yield the pure product as colorless crystals. Single crystals suitable for X-ray diffraction were obtained from slow evaporation of a solution of the pure title compound in dichloromethane/petroleum ether (1/4) at room temperature.

Refinement

All H atoms were found on difference maps, with C—H = 0.93–0.97 and included in the final cycles of refinement using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ and $1.5U_{\text{eq}}(\text{C})$ for the methyl H atoms.

Figures

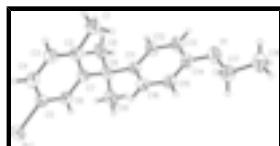

Fig. 1. View of the title compound, with displacement ellipsoids drawn at the 40% probability level.

supplementary materials

V = 1608.2 (6) Å ³	0.20 × 0.16 × 0.08 mm
Z = 4	

Data collection

Rigaku Saturn diffractometer	2839 independent reflections
Radiation source: rotating anode confocal	2101 reflections with $I > 2\sigma(I)$
ω scans	$R_{\text{int}} = 0.054$
Absorption correction: multi-scan (CystalClear; Rigaku, 2005)	$\theta_{\text{max}} = 25.0^\circ$, $\theta_{\text{min}} = 1.9^\circ$
$T_{\text{min}} = 0.630$, $T_{\text{max}} = 0.822$	$h = -13 \rightarrow 12$
13056 measured reflections	$k = -11 \rightarrow 11$
	$l = -17 \rightarrow 19$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.051$	H-atom parameters constrained
$wR(F^2) = 0.130$	$w = 1/[\sigma^2(F_o^2) + (0.070P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\text{max}} = 0.001$
2839 reflections	$\Delta\rho_{\text{max}} = 0.52 \text{ e \AA}^{-3}$
186 parameters	$\Delta\rho_{\text{min}} = -0.39 \text{ e \AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXTL</i> (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.026 (2)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
