Received 23 November 2010; accepted 3 December 2010

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.007$ Å; disorder in main residue; R factor = 0.108; wR factor = 0.201; data-to-parameter ratio = 12.1.

In the title compound, $\text{C}_{20}\text{H}_{24}\text{N}_4^{2+} \cdot 2\text{PF}_6^-$, the ethene and 3-allylimidazolium moieties of the cation are disordered over two positions with refined site occupancies of 0.664 (19):0.336 (19) and 0.784 (7):0.216 (7), respectively, whereas four F atoms of one hexafluoridophosphate anion and all atoms in the other hexafluoridophosphate anion are disordered over two positions with refined site occupancies of 0.764 (5):0.2365) and 0.847 (9):0.153 (9), respectively. The benzene ring is inclined at angles of 78.2 (3), 81.3 (4) and 73.9 (12)° with the 1*H*-imidazol-3-ium ring and the major and minor components of the disordered 1*H*-imidazol-3-ium ring, respectively. In the crystal, the hexafluoridophosphate anions link the cations into two-dimensional networks parallel to (001) *via* intermolecular C—H...F hydrogen bonds. The crystal structure is further consolidated by π - π [centroid-centroid distance = 3.672 (3) Å] and C—H... π interactions.

Comment

Carbenes are compounds possessing a neutral divalent carbon atom with six electrons on its valence shell. *N*-heterocyclic carbenes (NHCs) are cyclic carbenes that are usually derived from the deprotonation of imidazolium salts. NHCs are strong σ -donating ligands (Yang & Nolan, 2001; Böhm *et al.*, 2000) with negligible π -back bonding tendencies (Jafarpour & Nolan, 2001; Bourissou *et al.*, 2000; Herrmann *et al.*, 1996). The isolation of crystalline stable free NHC by Arduengo (Arduengo *et al.*, 1991) provided information on their fundamental properties. Many researchers have since prepared free NHCs for use in other reactions (usually for metal complexation reactions). Danopoulos and co-worker (Danopoulos *et al.*, 2002) isolated a stable phosphine-functionalised carbene. Various compounds that contain more than one carbene centres are known (Dias & Jin, 1994; Caballero *et al.*, 2001). Carbene have the ability to form complexes with many metals (Herrmann *et al.*, 1997), of which transition metals are the most interesting due to their potentials for catalytic activity. All transition metals have been complexed with NHC and the applications of compounds came to focus in many areas including the medical and biological sciences (Thompson *et al.*, 1999; Melaiye *et al.*, 2005).

In the title molecule (Fig. 1), the phenyl (C1-C6) ring is inclined at angles of 78.2 (3), 81.3 (4) and 73.9 (12)° with 1*H*-imidazol-3-ium (N1/N2/C8-C10, maximum deviation = 0.005 (5) Å at atom C10) ring, major component of 1*H*-imidazol-3-ium (N3A/N4A/C15A-C17A, maximum deviation = 0.008 (8) Å at atom N3A) ring and minor component of 1*H*-imidazol-3-ium (N3B/N4B/C15B-C17B, maximum deviation = 0.01 (3) Å at atoms N3B/C15B/C16B) ring, respectively. The ethene (C12/C13) and 3-allylimidazolium (N3/N4/C15-C20) moieties of the cation are disordered over two positions with refined site-occupancies of 0.664 (19) : 0.336 (19) and 0.784 (7) : 0.216 (7), respectively, whereas four fluorine atoms (F1A-F4A) of the hexafluoridophosphate (*A*) and a full hexafluoridophosphate (*B*) anion are disordered over two positions with refined site-occupancies of 0.764 (5) : 0.236 (5) and 0.847 (9) : 0.153 (9), respectively. Bond lengths (Allen *et al.*, 1987) and angles are within normal ranges and are comparable to a related structure (Haque *et al.*, 2010).

In the crystal packing (Fig. 2), the hexafluoridophosphate anions link the cations into two-dimensional networks parallel to (001) *via* intermolecular C3–H3A...F7A, C5–H5A...F5, C8–H8A...F11A, C10–H10A...F7A and C16A–H16A...F6 (Table 1) hydrogen bonds. π - π stacking interactions between the centroid of C1-C6 phenyl rings (Cg1), with Cg1...Cg1ⁱ distance of 3.672 (3) Å [symmetry code: (i) 1-X, 1-Y, -Z] are observed. The crystal structure is further consolidated by C20A–H20A...Cg2, C20B–H20C...Cg3 (Table 1) interactions, where Cg2 and Cg3 are the centroid of N3A/N4A/C15A-C17A and N3B/N4B/C15B-C17B rings, respectively.

Experimental

A mixture of imidazole (9.0 g, 130 mmol) and sodium hydroxide (5.0 g, 120 mmol) in DMSO (30 ml) was heated to 90 °C for 2 h. The mixture was cooled to room temperature and a solution of 1,3-bis(bromomethyl)benzene (15.0 g, 57 mmol) in DMSO (30 mL) was added, heated at 40 °C (1 h) and then poured into water (400 mL) followed by cooling in ice. Recrystallisation from methanol/water gives 1,3-bis(*N*-imidazole-1-yl methyl)benzene (**1**) as a white solid (9.0 g, 75%). Further, a mixture of **1** (0.5 g, 2.1 mmol) and allyl bromide (0.5 g, 4.2 mmol) in acetonitrile (30 mL) was refluxed at 90

supplementary materials

°C for 24 h. The solvent was removed under reduced pressure to give **2.2Br** as a pale-brown oil which was then reacted with KPF_6 (0.22 g, 1.2 mmol) in 20 ml of methanol to yield the title compound. Recrystallisation from acetonitrile gives title compound as colourless solid. Yield: 0.4 g (60%). Crystals suitable for x-ray diffraction studies were obtained by slow evaporation of the salt solution in acetonitrile at room temperature.

Refinement

All H atoms were positioned geometrically and refined using a riding model with $\text{C-H} = 0.93\text{--}0.97 \text{ \AA}$ and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. The highest residual electron density peak is located at 1.09 \AA from P2B and the deepest hole is located at 0.76 \AA from F10A. The ethene (C12/C13) and the 3-allylimidazolium (N3/N4/C15-C20) moieties of the cation are disordered over two positions with refined site-occupancies of 0.664 (19):0.336 (19) and 0.784 (7):0.216 (7), respectively, whereas four fluorine atoms (F1A-F4A) of the hexafluoridophosphate (*A*) and a full hexafluoridophosphate (*B*) anion are disordered over two positions with refined site-occupancies of 0.764 (5):0.236 (5) and 0.847 (9): 0.153 (9), respectively. The minor components of disorder were refined isotropically. The rather large R-values are due to the tremendous amount of disorder in the crystal structure.

Figures

Fig. 1. The molecular structure of the title compound showing 30% probability displacement ellipsoids for non-H atoms and the atom-numbering scheme. Both major and minor components of disorder are shown.

Fig. 2. The crystal structure of the title compound, viewed along the *c* axis. H atoms not involved in hydrogen bonds (dashed lines) have been omitted for clarity. Only major component of disorder is shown.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.108$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.201$	H-atom parameters constrained
$S = 1.14$	$w = 1/[\sigma^2(F_o^2) + (0.P)^2 + 16.2482P]$
5217 reflections	where $P = (F_o^2 + 2F_c^2)/3$
431 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.55 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.56 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg2 and Cg3 are the centroids of the N3A/N4A/C15A—C17A and N3B/N4B/C15B—C17B rings, respectively.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
C3—H3A \cdots F7A ⁱ	0.93	2.40	3.276 (6)	156
C5—H5A \cdots F5 ⁱⁱ	0.93	2.51	3.320 (6)	146
C8—H8A \cdots F11A ⁱⁱⁱ	0.93	2.27	3.107 (8)	150
C10—H10A \cdots F7A	0.93	2.25	3.130 (6)	158
C16A—H16A \cdots F6 ⁱⁱⁱ	0.93	2.48	3.407 (9)	172
C20A—H20A \cdots Cg2	0.93	2.89	3.489 (11)	123
C20B—H20C \cdots Cg3	0.93	2.84	3.44 (5)	124

Symmetry codes: (i) $-x+1, -y+1, -z$; (ii) $x, y-1, z$; (iii) $x+1, y, z$.
