Received 10 December 2010; accepted 11 December 2010

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.067;  $wR$  factor = 0.149; data-to-parameter ratio = 16.4.

In the title compound,  $\text{C}_9\text{H}_{12}\text{N}_2\text{O}_2$ , the acetohydrazide group is approximately planar [maximum deviation = 0.034 (2)  $\text{\AA}$ ]. In the crystal, molecules are linked via intermolecular  $\text{N}-\text{H}\cdots\text{O}$ ,  $\text{N}-\text{H}\cdots\text{N}$  and  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds into infinite two-dimensional networks parallel to (001).

## 2-(4-Methylphenoxy)acetohydrazide

H.-K. Fun, C. K. Quah, S. Malladi, V. A. M. and A. M. Isloor

### Comment

The full therapeutic possibilities of hydrazides were realized after the discovery of isonicotinic acid hydrazide (INH). Hydrazides and their derivatives have been described as useful synthons of various heterocyclic rings (Isloor *et al.*, 2009; Holla & Udupa, 1992). A large number of hydrazides and their derivatives are reported to possess a broad spectrum of biological activities (Ozdemir *et al.*, 2009; Khattab, 2005). The most widely used method to prepare hydrazides is hydrazinolysis of the corresponding esters with hydrazine hydrate (Yale *et al.*, 1953). Prompted by the diverse activities of hydrazides and its derivatives, we have synthesized the title compound to study its crystal structure.

The molecular structure is shown in Fig. 1. The acetohydrazide group ( $C_7/C_8/N_1/N_2/O_2$ ) is approximately planar, with the maximum deviation of  $0.034(2)$  Å at atom  $C_7$ . Bond lengths and angles are within normal ranges, and comparable to closely related structures (Fun *et al.*, 2009, 2010*a,b*). In the solid state (Fig. 2), the molecules are linked *via* intermolecular  $N_2-H_1N_2\cdots O_2$ ,  $N_2-H_2N_2\cdots O_2$  and  $C_1-H_1A\cdots O_2$  trifurcated acceptor bonds, together with  $N_1-H_1N_1\cdots N_2$  hydrogen bonds, into infinite two-dimensional networks parallel to plane (001).

### Experimental

Ethyl(4-methylphenoxy)acetate (1.94 g, 0.01 mol) and hydrazine hydrate (99%, 0.02 mol) in ethanol (15 ml) was heated on a water-bath for 6 h. Excess ethanol was removed by distillation. On cooling, colourless needle-shaped crystals of 2-(4-methylphenoxy)acetohydrazide begin to separate. It was collected by filtration and recrystallized from ethanol. Yield: 1.2 g, 67.0 %, *M.p.*: 411–413 K. (Conti, 1964).

### Refinement

$H_{1N_1}$ ,  $H_{1N_2}$  and  $H_{2N_2}$  were located in a difference Fourier map and allowed to refined freely. The remaining H atoms were positioned geometrically and refined using a riding model with  $C-H = 0.93$ – $0.97$  Å and  $U_{iso}(H) = 1.2$  or  $1.5$   $U_{eq}(C)$ . The highest residual electron density peak is located at 0.94 Å from  $H_{9C}$  and the deepest hole is located at 0.94 Å from  $C_8$ .

### Figures

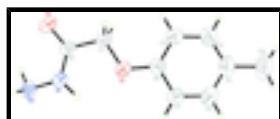

Fig. 1. The molecular structure of the title compound showing 50% probability displacement ellipsoids for non-H atoms and the atom-numbering scheme.

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.067$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.149$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.14$	$w = 1/[\sigma^2(F_o^2) + (0.0368P)^2 + 0.8025P]$ where $P = (F_o^2 + 2F_c^2)/3$
2150 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
131 parameters	$\Delta\rho_{\text{max}} = 0.21 \text{ e \AA}^{-3}$

0 restraints

$\Delta\rho_{\min} = -0.16 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
