## 2-[4-(Carboxymethyl)phenoxy]acetic acid

J.-D. Fu and Y.-H. Wen

### Comment

Various aromatic carboxylic acid ligands are being used in designing versatile metal-organic frameworks (MOFs) having potential applications (Kuppler *et al.*, 2009; Jahan *et al.*, 2010; Armelao *et al.*, 2010; Yashima *et al.*, 2009). In present work, we report the synthesis and single crystal structure of a new aromatic dicarboxylic acid ligand namely 4-carboxymethoxy phenylacetic acid (**I**) containing two flexible carboxylic acid groups, obtained by the reaction of 4-hydroxyphenylacetic (Gracin *et al.*, 2005) and chloroacetic acid (Sandhu *et al.*, 1991).

The molecular structure of the title compound is presented in Fig. 1. The carboxymethoxy group is almost parallel to the benzene ring with a dihedral angle of 11.4 (1) $^{\circ}$  between the two least-squares planes, while the acetic acid unit is almost perpendicular to the benzene ring, making a dihedral angle of 72.4 (2) $^{\circ}$ . In addition, the molecules were linked by the intermolecular O—H $\cdots$ O hydrogen bonding forming a three-dimensional network (Fig. 2).

### Experimental

The solution of 4-hydroxyphenylacetic acid (1.522 g, 10.0 mmol) in water (10 ml) neutralized with NaOH (0.8 g, 20 mmol) was added to a 1:1 mixture of chloroacetic acid (3.78 g, 40 mmol) and NaOH (1.600 g, 40 mmol) with stirring to adjust the pH value of the mixture to *ca* 11 and refluxed at 90  $^{\circ}$ C for 3 h. The pH value was adjusted to 2–3 with concentrated hydrochloric acid. While cooling the mixture to room temperature, a white precipitate was appeared rapidly. The solid was filtrated, washed by water. Single crystals suitable for X-ray diffraction were obtained in the mother liquid after evaporation within a few days.

### Refinement

The Flack parameter could not be refined to an acceptable value as the title compound is a poor anomalous scatterer even after using MOVE command in Shelxl97. Therefore, the Friedel opposites were merged (using MERG 3 command in Shelxl97) and Flack parameter is not reported. H-atoms were positioned geometrically and included in the refinement using a riding-model approximation [aromatic C—H = 0.93 Å, aliphatic C—H = 0.97 Å, O—H = 0.82 Å] with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{O})$ .

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
