Received 2 November 2010; accepted 6 January 2011

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{Ni-B}) = 0.004 \text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.020;  $wR$  factor = 0.045; data-to-parameter ratio = 15.7.

The  $\tau$ -boride  $\text{Ni}_{23-x}\text{Bi}_x\text{B}_6$  [ $x = 2.44 (1)$ ] adopts a ternary variant of the cubic  $\text{Cr}_{23}\text{C}_6$ -type structure, with  $\text{Ni}_8$  cubes and  $\text{Ni}_{12}$  cuboctahedra arranged in a  $\text{NaCl}$ -type pattern. Two of the four independent metal sites ( $8c$ ,  $\bar{4}3m$  symmetry;  $4a$ ,  $m\bar{3}m$  symmetry) are occupied by a mixture of Ni and Bi atoms in a 0.106 (6):0.894 (6) and a 0.350 (7):0.650 (7) ratio, respectively.

### Related literature

For the structure of  $\text{Cr}_{23}\text{C}_6$ , see: Westgren (1933). For other examples of  $\tau$ -borides, which have more than 80 representatives, see: Villars & Calvert (1985). For ternary ordered variants, see: Hillebrecht & Ade (1998) for  $M_{20}M'_3\text{B}_6$ ; Veremchuk *et al.* (2009) for  $M_{21}M'_2\text{B}_6$ . For isotropic cobalt-containing solid solutions  $\text{Co}_{23-x}M'_x\text{B}_6$ , see: Kotzott *et al.* (2009).

## Nickel bismuth boride, $\text{Ni}_{23-x}\text{Bi}_x\text{B}_6$ [ $x = 2.44$ (1)]

D. Berthebaud, A. Sato and T. Mori

### Comment

$\text{Ni}_{23-x}\text{Bi}_x\text{B}_6$  belongs to a class of metal-rich compounds known as  $\tau$ -borides, which are interesting ceramic materials. It is isostructural to numerous related  $M_{20}M'_3\text{B}_6$  and  $M_{21}M'_2\text{B}_6$  ( $M = 3d$  metal;  $M' =$  rare-earth,  $4d$ ,  $5d$ , or main-group metal) phases, which adopt a ternary variant of the cubic  $\text{Cr}_{23}\text{C}_6$ -type structure (Westgren, 1933; Villars & Calvert, 1985; Hillebrecht & Ade, 1998; Veremchuk *et al.*, 2009). Of the four metal sites, two (32f and 48h) are occupied exclusively by Ni atoms giving a NaCl-type arrangement of  $\text{Ni}_8$  cubes and  $\text{Ni}_{12}$  cuboctahedra, and two (4a and 8c) are occupied by a mixture of Ni and Bi atoms, resulting in the composition  $\text{Ni}_{20.56}\text{Bi}_{2.44}\text{B}_6$  (Fig. 1). Mixed occupation of the 4a and 8c sites has also been previously reported in the Co-containing  $\tau$ -borides  $\text{Co}_{23-x}M'_x\text{B}_6$  (Kotzott *et al.*, 2009).

### Experimental

A mixture of Ni, Bi, and B powders with nominal composition  $\text{Ni}_{20}\text{Bi}_3\text{B}_{12}$  was pressed into a pellet and placed in an alumina crucible. It was melted under Ar gas at 1473 K for 6 h, cooled at  $20 \text{ K h}^{-1}$  to 1273 K, and further cooled at  $300 \text{ K h}^{-1}$  to room temperature. The sample contained crystals of the title compound, in the presence of binary nickel borides, as revealed by powder X-ray diffraction analysis.

### Refinement

Several models involving mixed occupancy of Ni and Bi atoms, or vacancies (or both) within the metal sites were considered. We concluded that all sites are fully occupied, but two of them (4a and 8c) were disordered with a mixture of Ni and Bi atoms. Only an isotropic displacement parameter was refined for the B atom. The highest peak and the deepest hole in the final difference map are located at 2.12 and 0.57 Å from Ni3 and Bi1, respectively.

### Figures

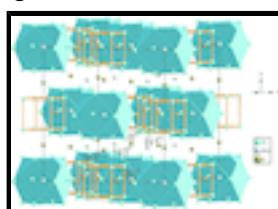

Fig. 1. Structure of  $\text{Ni}_{23-x}\text{Bi}_x\text{B}_6$  highlighting the arrangement of  $\text{Ni}_{12}$  cuboctahedra (Ni3, 48h) and  $\text{Ni}_8$  cubes (Ni2, 32f). Displacement ellipsoids are drawn at the 60% probability level. Symmetry codes are defined in the footnote of the table of geometric parameters.

## Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.020$	$w = 1/[\sigma^2(F_o^2) + (0.0165P)^2 + 39.3966P]$
$wR(F^2) = 0.045$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.16$	$(\Delta/\sigma)_{\text{max}} < 0.001$
236 reflections	$\Delta\rho_{\text{max}} = 2.18 \text{ e \AA}^{-3}$
15 parameters	$\Delta\rho_{\text{min}} = -2.22 \text{ e \AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008)
	Extinction coefficient: 0.00047 (4)

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
