Received 12 October 2010; accepted 5 January 2011

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.009\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.043;  $wR$  factor = 0.123; data-to-parameter ratio = 13.4.

The asymmetric unit of the title compound,  $[\text{Sm}(\text{NO}_3)_3 \cdot (\text{C}_{15}\text{H}_{15}\text{NO}_2)_2(\text{CH}_3\text{OH})]$ , contains two Schiff base 2-methoxy-6-[(4-methylphenyl)iminoethyl]phenolate ( $\text{HL}$ ) ligands, three nitrate ions and one methanol molecule that binds to the nine-coordinate samarium(III) ion *via* its O atoms. The  $\text{HL}$  ligands chelate with a strong  $\text{Sm}-\text{O}$ (deprotonated phenolic) bond and a weak  $\text{Sm}-\text{O}$ (methoxy) contact. The latter can be interpreted as the apices of the bicapped square-antiprismatic  $\text{Sm}^{\text{III}}\text{O}_9$  polyhedron. The Schiff base ligands are in a zwitterionic state with the phenolic H atom transferred to the imine N atom.  $\text{O}-\text{H}\cdots\text{O}$ ,  $\text{O}-\text{H}\cdots\text{N}$  and  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds lend stability to the structure. One O atom of one nitrate group is equally disordered over two positions.

### Comment

Schiff base complexes utilizing ligands obtained from substituted *o*-vanillin have been attracted considerable attention in past decades due to the intriguing biological activities of *o*-vanillin (Zhao *et al.*, 2005) and its convenience in Schiff base syntheses (Burrows & Bailar, 1966). Interested in this field, we have been engaged in a major effort directed toward the development of syntheses of new analogous Schiff bases derived from *o*-vanillin and their rare metal complexes. In a few of articles we have reported our partial research results (Zhao *et al.*, 2005; Xian *et al.* 2008; Li *et al.* 2008; Liu *et al.*, 2009). Herein, we describe a new Sm<sup>III</sup> complex.

The structure of the title complex is shown in Fig. 1. In this complex, the O5 atom in a nitrate anion is disordered over two sites (assigned in a 50: 50 ratio). The Sm<sup>III</sup> is nine-coordinated by O atoms, six of which come from three nitrate ions, one from methanol and two from the Schiff base ligands (HL). The HL ligands coordinate to the Sm<sup>III</sup> ion using oxygen atoms from deprotonated phenolic hydroxyl groups. Interestingly, the Schiff base ligands are in a zwitterionic state with the phenolic H transferred to the imine N. The bonds between Sm<sup>III</sup> and O atoms from phenoxy groups are 2.486 (3) and 2.428 (3), which are shorter than those between Sm<sup>III</sup> and O atoms of methoxyl groups (2.806 (4) Å and 2.957 (4) Å for Sm—O2 and Sm—O4). The nitrate anions coordinate to the Sm<sup>III</sup> via O atoms with distances ranging from 2.59 (2) to 2.743 (5), which are intermediate between the Sm—O(phenolic) and the Sm—O (methoxy) bond lengths. The Sm—O(methoxyl) bond length is only slightly longer than that for Sm—O(phenolic), and these values are similar to those reported for related complexes (Liu *et al.*, 2010).

The hydrogen bonds and  $\pi$ – $\pi$  weak non-covalent interactions lend stability to the structure. The hydrogen bonds are listed in Table 2 and the stacking plot of this compound is shown in Fig. 2. Different lines are interlocked with benzene rings of Schiff base using  $\pi$ – $\pi$  stacking. As indicated above, in the HL ligands, the proton of the phenolic hydroxyl group has been transferred to the *N*-imine atom, and is involved in an intramolecular hydrogen bond (Table 2).

### Experimental

Reagents and solvents used were of commercially available quality and used without further purification. The Schiff base ligand 2-[(4-methylphenyl)iminomethyl]-6-methoxy-phenol was prepared by condensation of *o*-vanillin and *p*-methylaniline with a high yield and which was purified by recrystallization in ethanol. The compound (1) was obtained by adding Sm(NO<sub>3</sub>)<sub>3</sub> (1 mmol, dissolved in methanol) to *N*-salicylidene-*p*-toluidine (2 mmol) in methanol solution. The solution was stirred at room temperature for 8 h to obtain a purplish red solution. At last, the deposit was filtered out and the solution was kept for evaporating. Red crystals were formed after several days.

## Refinement

The structure was solved by direct methods and successive Fourier difference synthesis. The H atoms bonded to C and N atoms were positioned geometrically and refined using a riding model [aliphatic C—H = 0.96 Å ( $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ ), aromatic C—H = 0.93 Å ( $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ ) and N—H = 0.86 Å with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ .

## Figures

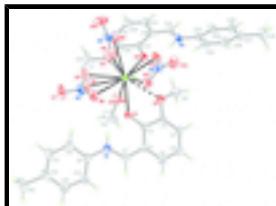

Fig. 1. The molecular structure of the title complex, showing the atom-labeling scheme. Weaker bonds to methoxy O donors shown with dashed lines. Displacement ellipsoids are drawn at the 30% probability level.

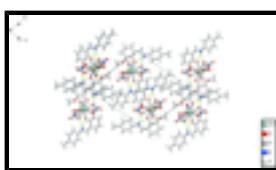

Fig. 2. The stacking plot of the title compound, showing H-bond interactions (dashed lines) and  $\pi-\pi$  stacking interactions.

### Refinement

Refinement on  $F^2$

Primary atom site location: structure-invariant direct methods

Least-squares matrix: full

Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.043$

Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.123$

H-atom parameters constrained

$S = 1.05$

$$w = 1/[\sigma^2(F_o^2) + (0.0718P)^2 + 2.0645P]$$

where  $P = (F_o^2 + 2F_c^2)/3$

6337 reflections

$$(\Delta/\sigma)_{\max} = 0.001$$

474 parameters

$$\Delta\rho_{\max} = 0.91 \text{ e \AA}^{-3}$$

0 restraints

$$\Delta\rho_{\min} = -0.73 \text{ e \AA}^{-3}$$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
